REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are temperatures in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 4 are from recording gages Traces are not shown.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6, and snowfall data in Table 7 are for the 24 hours ending at time of observation See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

- - No record in Tables 3, 4, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry. When hourly precipitation is missing or accumulated for several days only the first and last days are shown in Table 4.
- † Mount Washington WB New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates
- * Amount included in following measurement, time distribution unknown.
- Gage is equipped with a windshield
- b Station not equipped with recording gage, see Table 4 for 6-hourly measured amounts.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure
- V Includes total for previous month.

Subscription Price 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1951

NEW ENGLAND - OCTOBER 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

Generally pleasant autumn weather continued to favor the Section, with the temperature average slightly above normal and with occasional precipitation of moderate amount. There were few really hot days and the monthly temperature average was raised to above normal by lack of cold nights. The threat of a severe coastal disturbance on the 7-8th was averted as the storm center was diverted to sea. Only south coastal areas experienced strong winds or gales, but heavy rain fell in all but the extreme northern parts. Such polar air thrusts as reached New England lost much of their effectiveness in passing over relatively warm surface, and little hard freezing resulted even in northernmost parts except for brief intervals. The growing season was ended for tender vegetation in all areas except immediate coastal, but the surviving hardy vegetables continued to thrive and came to market in good supply. The frequent pleasant periods afforded opportunity to complete harvesting of the important fall crops of apples and cranberries, both of better than average yield and quality. Potato harvesting in northern Maine neared completion by the middle of the month despite the frequent rains. This late-season moisture favored the spread of blight with consequent deleterious effect on grade and volume.

On the night of the 24th and early morning of the 25th a squall-line moved eastward across New England in advance of an active cold front. Showers were very heavy for several hours, and squall winds, though of brief duration, were of dangerous velocity in the gusts. This rain eliminated the fire hazard that had developed in the woods. Again on the 28th a frontal disturbance which developed over eastern Virginia moved northeastward just off the coast, increasing rapidly in energy and precipitation-producing capacity as it progressed so that northern New England received an unseasonably early first general snowstorm of the season. Three to six inches fell in northern and central Maine and northern New Hampshire. In the White Mountain Region, highway plows, usually idle until December, operated on a 3 to 4 inch accumulation. In Maine, 100 poles were felled, 99 phone circuits knocked out. A troop of Bangor Boy Scouts, lost in the woods near East Eddington, were forced to spend the night in the drenched woods. One of their number died from exposure. Vermont, in the Montpelier area, had about an inch of snow.

Stream flow, as in September, continued above normal in response to the above normal rainfall in many parts of the Section. In southeastern counties of Massachusetts, however, there has not yet been sufficient rain to restore normal water supplies.

The average Section temperature, based upon the records from 161 stations, was 50.8°, which is 1.1° above the mean for the past 64 years. The highest monthly average temperature reported was 57.1° at Provincetown, Mass., and New London, Conn.; the lowest was 44.0° at Caribou, Me. The highest reported was 86° at Hoosac Tunnel, Mass., on the 6th; the lowest was 15° at Gardiner, Me., on the 21st and Fabyan, N. H., on the 30th.

The average monthly precipitation, based upon the records of 158 stations, was 3.84 inches, which is 0.42 inch more than the mean for the past 64 years. The greatest monthly amount reported was 7.03 inches at Somerset, Vt.; the least was 1.40 inches at Eustis, Me. The greatest amount reported in any observational day was 3.93 inches at Somerset, Vt., on the 8th. The average snowfall for the Section was 0.5 inch, which is 0.3 inch more than the mean for the past 64 years. - M.T.N.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7 30 P.M. E.S.T.

- - No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND - NOVEMBER 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

The average precipitation for the Section, 6.26 inches, was the fourth greatest amount for November in the 64 years of available computations. It was exceeded by rather small margins in 1888, 1927 and 1950.

The month opened with a heavy rainstorm in east and south portions and snow to the west and north, as a wave disturbance moved rapidly northeastward from the Carolina Highlands to Nantucket. One to two inches of snow fell in the Berkshires and two or three times as much in northern highlands. The greatest reported amount was 10 inches at Northfield, Vt. On the coast the driving northeast winds forced the spring tide to abnormally high levels, inundating wharves and shore roads, while heavy surf battered the sea-walls. Ship movements in harbor were suspended until the gale abated toward nightfall. The Narragansett shore from Point Judith to Newport, R.I., took a terrific beating, with extensive damage to sea-walls, summer homes and pleasure craft. At Quonset Point the gusts reached a rate of 74 mph. Many small craft were total losses, including cabin cruisers 24, 32 and 52-feet long. Seaview Drive, at Oakland Beach, was washed out. At Occum, Conn., a printing plant was de-roofed; the sprinkler system was set off, which, together with the heavy rain, damaged stocks and fixtures. Total precipitation in these first three days exceeded two inches at most stations, three inches at many, and four inches over Rhode Island and Middlesex and Worcester Counties of Massachusetts.

Two days later another quickly developing storm moved northeastward along the coast to Long Island Sound, thence up the Connecticut Valley, again with heavy general precipitation, this time with south-southeast gales, which reached hurricane velocity in the gusts. At Blue Hill, Mass., a rate of 96 mph was attained at 11:21 am, this slightly exceeding the highly destructive gusts of last November's hurricane. The warm air blast raised temperatures rapidly to the upper 60's (71° at the East Boston Airport), followed shortly by an equally abrupt drop to near or below freezing during the night. About 7200 telephones were out of service in New England due to wet cables or broken lines. Power suspensions affected 20,000 homes in eastern Massachusetts, and dozens of plate-glass windows were smashed. Leaf-clogged catch basins flooded streets and cellars. Numerous fatal accidents occurred, some partly attributable to weather causes. A lobsterman was drowned off Winthrop, Mass., shore, when the rough sea swamped his boat. A sidewalk fall killed a man in Brighton. On the 8th, still another disturbance moved northeastward from the Middle Gulf States and there was a repetition of heavy downpours all over the Section. Hardest hit was the area around Belfast, Me., where 3.55 inches fell, closely following the 4.14 inches of the previous storm. Warm, moist air moved in again and the snow that had accumulated in the northern highlands disappeared suddenly under the warm, drenching rain. Over extreme northern portions, however, freezing rains coated highways with a treacherous glaze. Streams rose from already full levels, reached as a result of the three antecedent heavy storms. The Narragansett shore of Rhode Island was again belabored by the pounding storm tides which altered beaches and smashed sea-walls.

The middle decade of the month was mild, particularly around the 14-15th, when maximum temperatures attained 65 to 71° over the Southern Division, and but a few degrees less in the north. After the 20th there were three intrusions of cold Canadian air between minor storms. On the 26th snow fell in 2 to 17 inch amounts, with the greatest depths in northern Maine. Some five hundred motorists were stranded on Aroostook roads. Icy gales which followed contributed to several marine disasters, one in New England waters, on Cuttyhunk Island, where the Gloucester dragger "Mary M" went ashore and broke in two, costing five lives. Temperatures ranged well below normal in this decade and in the north minima fell to zero to -12° on the 28th. The heavy rainfalls naturally caused excessive runoffs in all streams and minor freshets in many. Storage water increased and ground-water levels rose in response to the abundant continuing supply.

The average Section temperature, based on the records from 161 stations, was 35.5°, which is 2.7° below the mean for the past 64 years. The highest monthly average reported was 46.9° at Provincetown, Mass. and the lowest was 26.4° at First Connecticut Lake, N.H. The highest reported was 77° at Provincetown Mass., on the 17th, while the lowest was -12° at West Burke, Vt., on the 28th.

The average monthly precipitation, based on the records of 160 stations, was 6.26 inches, which is 2.58 inches more than the mean for the past 64 years. The greatest monthly amount reported was 11.48 inches at Baltic, Conn., and the least was 3.23 inches at Whitefield, N.H. The greatest amount reported in any observational day was 3.90 inches at Lac Frontiere, Me., on the 3d. The average snowfall for the Section was 7.8 inches, which is 3.2 inches more than the mean for the past 64 years. - M.T.N

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7·30 P.M. E.S.T.

- - No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND - DECEMBER 1951

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

This first month of winter presented some marked contrasts as to temperature, barometric pressure ranges and storminess. It was rather a wet month-precipitation totals were well above normal at all except a few extreme northern stations. More than six-inch totals were reported at a few stations in each State. The snowfall accumulation was greater than usual so early in the season, especially in the interior highlands in the latter half of the month. Ice accretion was rapid after the 10th, facilitating the early harvesting of natural ice, still a locally important industry in many of the smaller rural communities.

During the first decade a series of storm systems moving rapidly eastward at short intervals through southern Canada effectively barred any intrusion of cold air, so that the daily excess of temperature averaged near 12°. In some instances, as on the 5th and 8th, date records of long standing for high maxima were exceeded. Except in the mountains and the extreme north, there was little snow cover and even there it nearly disappeared by the 10th. Thereafter for the next ten days the pattern of action underwent a complete reversal. Low pressure areas repeatedly developed over the Southwestern Plains and moved northeastward with increasing intensity. The influx of warm, moist marine air over the Middle and North Atlantic coastal plains meeting the advancing cold fronts furthered the generation of energetic secondary centers on the coast, which soon became the principal cyclonic systems, depositing heavy precipitation in New England. Typical was the action on the night of the 14th. A major low pressure area system moved northeastward from Oklahoma, drawing inland moist ocean air, which cooled aloft and deposited 3 to 11 inches of snow over all except south-coastal parts of the Section. There freezing rain for a time created travel hazards. The intense cold that followed aggravated the human strains and discomforts. There were innumerable skidding accidents and injuries from falls. Nineteen deaths were reported, mostly due to heart failure induced by shovelling snow or combatting the storm. The cold air drawn down in the rear of the storm depressed temperatures in the Northern Division on the morning of the 17th to 10 to 30° below zero in the Northern Division and to correspondingly sub-normal levels in the Southern Division. In fact, it was the most severe and extensive cold-wave of official record so early in the season, a week before the Winter Solstice, and rivalling the frigid onslaught of December 30, 1933. Four days later there was practically a repeat performance of this routine as another major storm moved rapidly northeastward over the Central Valleys and the Lake Region, again with a secondary coastal development that brought another heavy snowstorm to the northern interior and snow, rain, freezing rain, and even hail with a thunderstorm to southern New England. The Martha's Vineyard station reported a "twister" (see below). The death toll over the Section was reported as 5, 4 in Boston and 1 in Brockton. In Woonsocket, R. I., the weight of rain-soaked snow collapsed the roof of a small house. The occupants were extricated from the crumbling walls unhurt. A lightning bolt struck a home in Lordship, Conn., doing minor damage and injuring the owner. In Laconia, N.H., a man was knocked unconscious while plowing snow, an accident probably unique in New England weather casualties. There was some damage to chimneys and fire alarm systems in Middlesex and Suffolk Counties, Mass. Blinding snow and rain obscured the vision of a Boston and Maine Deisel engine operator, the locomotive plowed into the rear of a Medford train, and five homeward bound commuters were injured. Hundreds of cars were stalled as backed-up water flooded streets. In Connecticut, the rains from the 15th to 21st totalled 3.50 to 4.00 inches, producing moderate floods in most streams. Again the sub-zero air hovering along the central Canadian boundary was drawn down in the rear of this storm. This invasion was short-lived, however, as the third northeastward moving depression, with its coastal secondary appendage brought in warm, moist, marine air with a 40 to 70° temperature rise in 24 hours. At Keene, N.H., there was a 73° rise in 36 hours (20-21st). Barometric changes were likewise sharp in tempo with the rapid passage of strong high and low pressure cells. A drop of an inch in 13 hours on the night of the 14th, and an inch in 12 hours on the 18th, and 1.02 inches in 20 hours on the 20-21st at Boston illustrate this. The intervening rising pressure reactions were only slightly less emphatic. Winter sports resorts, favored by two or three substantial snowstorms, began to function normally in the Northern Division, but only sporadically in the Southern Division. At least there was some encouragement for the operators, who have suffered discouraging losses in the past two mild winter seasons.

The last decade presented a couple of moderate storms, mostly snow in northern, and snow and rain in southern portions. On Christmas night, where bare ground had appeared over most of the Southern Division there was general deposit of one to four inches. This became wet, then frozen, and caused dangerous travel conditions. More than 50 minor accidents occurred in the Boston area and hundreds over the Section. The deep snow cover in the northern highlands became somewhat depleted in the last two days. As in November, the stream flow and storage reservoir and ground-water levels remained well above normal.

The average Section temperature, based upon the records from 167 stations, was 27.0°, which is 0.6° above the mean for the past 64 years. The highest monthly average reported was 41.5° at Provincetown, Mass.; the lowest was 14.3° at Caribou and Fort Kent, Me. The highest reported was 65° on the 5th and 8th at several stations; the lowest -31° at Lemington, Vt., and Lac Frontiere, Me., on the 20th. The average monthly precipitation, based on the records of 165 stations, was 4.61 inches, which is 1.26 inches more than the mean of the past 64 years. The greatest monthly amount reported was 7.56 inches at Stevenson Dam, Conn.; and the least was 1.68 inches at Enosburg Falls, Vt. The greatest amount reported in any observational day was 2.64 inches at Austin, R.I., on the 21st. The average snowfall for the Section was 21.2 inches, which is 9.9 inches more than the mean for the past 64 years.

"BABY TORNADO" on Martha's Vineyard. On the night of the 18th, while the characteristics of a severe frontal thunder-squall were observed over most of the Southern Division, a center of particularly violent action was over the section known as Ocean Heights, essentially a summer community, with light frame cottages, mostly vacant. Here there was damage of a kind to indicate the probability of the occurrence of a small tornado. A cottage had its walls bulged outward, another lost storm windows, frames and all completely disappearing, another was lifted from its foundation and set down intact six feet away, without the breaking of a window-pane. A garage disintegrated, walls and roof were nowhere to be found. These effects were momentary. One of the few persons in residence stated: "I felt for a second as if I were in a vacuum and the house seemed to be trying to break away from its foundations. The house vibrated and the sink began to gurgle." These manifestations probably occurred shortly after 6 p.m., approximately at the time when other parts of central and southern New England were experiencing severe wind-squall and lightning attacks. Barograms traced an extremely rapid fall in pressure, then showed a characteristic, and this time, greatly exaggerated "thunderstorm nose". This recalls a similar visitation on December 2, 1942, when, between 2 and 3 a.m., lightning struck several buildings over eastern Massachusetts, including the Head House at City Point, South Boston, set afire by lightning and nearly destroyed. Frontal thunderstorms in winter, though not uncommon, rarely reach dangerous proportions - only when great instability effects extreme violence of action. Within the period of Weather Bureau record, the only such storms of comparable severity were those described above and one on February 28, 1891, also during the night, when most of Cape Cod was ravaged. - M.T.N.

CORRECTIONS

MONTH: JULY 1951

Table 2:	New London, N. H.	Lowest temperature for month should be 50° on 21st.

MONTH: SEPTEMBER 1951

Table 2:	Mt. Washington, N. H.	Mean temperature should be 40.8°; degree days, 720.
Table 5:	Mt. Washington, N. H.	Minimum temperature on 8th should be 26°; Mean minimum temperature should be 35.0°.

MONTH: OCTOBER 1951

Table 3:	Eustis, Maine	Amount on 31st and monthly total should be *.
Table 5:	Jonesboro, Maine	Mean maximum temperature should be 59.0°.

MONTH: NOVEMBER 1951

Table 2:	Portland, Maine	Lowest temperature should be 15° on 28th.
Table 2:	Prentiss, Maine	Lowest temperature should be 0° on 27th.
Table 5:	Manchester, N. H.	Minimum temperature on 23rd should be missing.

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

-	No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
††	Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
+	And also on a later date or dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with a windshield.
AR	This entry in time of observation column in the Station Index means after rain.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	1 to 9 days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
SS	This entry in time of observation column in the Station Index means sunset.
T	Trace, an amount too small to measure.
V	Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND

ANNUAL SUMMARY 1951

Volume LXIII No. 13

CHATTANOOGA: 1952

NEW ENGLAND - 1951

Mark T. Nesmith, Section Director - Boston, Mass.

WEATHER SUMMARY

The early months were much milder than normal, comprising the finale of one of the mildest of winters. The ground was well conditioned for the start of the growing season, but early spring was so cloudy as to delay germination. Then followed another deterrent in the form of extremely dry air. In early May, relative humidity readings as low as 8%, the lowest ever noted in this area, combined with strong N-NW winds were highly effective in drying out wet fields, and dehydrating forest floors to a state of high hazard. During the rest of the season, however, rains were generally adequate and crops came through in good volume and quality. Grasses and pasture lands were especially lush, benefitting all phases of the dairy industry. The harvest season, too, was favorable for the garnering of the great tobacco, apple and cranberry crops. The copious general rains of the last two months completed the recovery of water levels, storages and streams to normal or above - a boon to the communities where alarming shortages had been a recurrent harassment in recent years.

With an average of 46.8°; the year as a whole was only 0.9° above normal in temperature. The average precipitation was 48.75 inches, making this the wettest year in the last six, though a half-dozen others in the 64 years of record have exceeded it. The total average precipitation in the Northern Division was 48.49 inches; in the Southern Division 49.09 inches. The highest annual mean temperature was 53.3° at Waterbury City Hall, Conn.; the lowest 37.9° at First Connecticut Lake, N. H. The highest individual reading reported was 94° at several stations on July 17th or 26th; the lowest was -47° at Lac Frontiere, Maine on January 31.

The greatest annual amount of precipitation was 67.45 inches at Searsburg Station, Vt., the least 30.85 inches at New Bedford, Mass. The greatest local monthly amount was 11.48 inches at Baltic, Conn. in November; the least 0.23 inch at Chatham, Mass. in September. The greatest amount reported in any observational day was 5.11 inches at Edgartown, Mass., measured on August 9.

The total snowfall in the calendar year for the Section was 64.6 inches, an inch more than normal. The average total snowfall in the Northern Division was 87.4 inches, 5.9 inches more than the mean in the past 64 years; in the Southern Division, 36.9 inches, 9.1 inches less than the 64-year mean.

January was characterized, as were the last two months of 1950, by persistent mildness and infrequency of severe storms. Winter sports activities were hampered by the lack of snow, which, when it did fall, was ruined by quickly following mildness. The first general snowstorm occurred on the night of the 7-8th - this was followed by a cold wave which brought subzero temperatures to the interior. Mild weather ensued, continuing for two weeks. An abrupt but brief change came on the 21st as a great surge of cold Canadian air descended in the rear of a deepening depression that moved from Ontario to the Labrador coast. Mildness soon returned for a few days, gradually giving way before a southward-flowing cold air mass, which brought the coldest weather of the winter. Despite these cold waves, the monthly average temperature was well above normal.

February. Extremely high temperature followed the intense cold at the end of January. This was suddenly displaced by a tropical air mass, though not before several inches of snow had fallen, changing to a freezing rain, drizzle and sleet. With heavy fog and visibility down to near zero, the glaze caused a most hazardous condition. This was the fifth successive month that opened with a warm front transit. Snows were frequent thereafter over the Northern Division, but very scanty in the Southern Division except for a 12-16 inch fall in Nantucket, Cape Cod, and Rhode Island, as an energetic storm passed northeastward off the coast on the 3-4th. The only other noteworthy storm, that of the 7-8th, battered all New England. Most of the Section was again in a warm sector. Heavy rains fell on the night of the 7th, except in interior highlands, where there was moderate snow. Wind gusts attained 50 to 87 mile per hour rates from the southwest. Rivers rose; ice jams caused local flooding. Coastal damage was high, particularly in Maine. Winds wrought havoc in inland parts of Northern Maine. In the next three days, piercing cold, driven by northwest gales, occasioned much hardship. Springlike mildness followed on the 12-13th, breaking date records, and the latter half of the month maintained the unseasonable warmth almost unbroken, resulting in the third warmest February in the 64 years of record.

March. Although precipitation occurred with greater frequency than in any other March in the last half-century, and the monthly average was well above normal, the temperature was high enough so that more than the usual proportion was in the form of rain. Thus there was an early termination to the winter sports season, which likewise had a late beginning, and was unsatisfactory throughout; this following two previous unfavorable seasons. Although in this month it was possible to recoup some of the early season losses in the mountain resorts in the Southern Division east of the Berkshires, and in southern parts of the Northern Division, only 2 to 7 inches of snow fell in the entire month. By the final week, snow was melted except in the mountains, and even there less than the usual amount was impounded for spring melt. Though a little warmer than March usually is, the percentage of sunshine was extremely low.

April. Although there were a few warm days, the lack of low night temperatures lifted the monthly average to well above normal. There was too much cloudiness to effect drying of the soil, and early-season farm work was retarded until the latter half of the month. There were many rainy days, and, during the period 7th to 16th, almost daily outbreaks of frontal showers. Later there were two major storms, one in the Southern Division on the 23d, another in the Northern Division on the 26th, both bringing rather heavy rains. The spring runoff was at its height during the first week. However, despite what had been a serious threat from heavy rain and snow melt, the stream flow was so distributed as to end the menace after a few dry days.

May. The monthly averages of temperature and precipitation were close to normal. The first week, however, was one of extreme dryness all over the Section. At the Section Center on the 2d, the relative humidity lowered to 8% in the late afternoon, the lowest reading in the 81-year record, this was a close approach to desert dryness, and with the strong north-northwest winds was highly effective in the drying of wet fields and the dehydrating of forest floors. Fires broke out at numerous points in the six states, but they were mostly confined to small areas. This high hazard, temporarily relieved by showers, recurred on the 9th and again on the 16th. The latter date also marked the first heat wave of the season, maximum temperatures attaining 90° or over in the Southern Division. At Portland, the 90° maximum was 2° higher than any record so early. Germination and crop growth were satisfactory, though heavy to killing frosts on the 18-19th damaged tender young plants that had developed in the intervening days of warmth.

June. There was some warm summer weather during the first four days and again in the third week, but cool periods offset the warm to the extent of lowering the monthly average to a little below normal. Several disagreeable weekends and lack of any extended warm, sunny periods retarded seasonal activities or commitments, discouraged pleasure travel, slowed plant growth, and afforded farmers scant opportunity to cut and store the fine hay crop. Most crops showed a healthy though rather slow advance.

July. The temperature average was near normal. Rainfall varied widely from over six inches in much of Maine and northern Massachusetts, to an inch or less in southeastern Massachusetts and southern Rhode Island. The first wholly pleasant weekends since last November occurred in the early half, stimulating the lagging recreational business. Hot weather crops throve. Electrical storms were mild until a series of thunderstorms in the 16-19th period raised havoc in various parts of the Section by rain, hail and wind damage to an estimated total of a million dollars. The greatest financial loss was to shade-grown tobacco crops in the Connecticut Valley.

August. Another month with averages, both of temperature and precipitation, close to normal. There was one decidedly cool period around the 5-7th, when some stations in the lower Merrimack Valley reported the lowest minimum of record. No excessively hot weather occurred, and as rainfall was ample, all crops advanced toward healthy maturity. Electrical storms caused considerable local damage, both to crops and other property. An unprecedented series of small tornadoes which were generated along a squall-line extending from western Connecticut through northeastern Massachusetts ravaged many smaller communities on the 21st. Had they passed over more thickly settled areas, the lethal consequences might have approached those of the historic New England tornado disasters at Wallingford, Connecticut in 1878, and at Lawrence, Mass., in 1890. Ground fogs inland and seafogs alongshore were prevalent to the extent of deterring vacation travel and business.

September. A generally pleasant month with cool weather in the first and last weeks, but warm in the middle fortnight. Over much of the Northern Division, tender vegetation succumbed to a light freeze on the 27th, followed on the 30th by a general freeze that terminated the growing season except in coastal or protected areas. Rainfall was adequate except in southeastern Mass., where water shortages of two years standing continued. Most crops throve, and continued fine pasturage aided all phases of dairying. Picking of the great apple and cranberry crops proceeded apace. Harvesting of tobacco in the Connecticut Valley was completed under more favorable weather conditions than in August. The warm middle weeks with lower humidity favored curing.

October. The general level of temperature continued a little above normal, with no marked departures in either direction. Such hardy vegetation as had survived the freeze of Sept. 30, advanced to healthy maturity, and the late crops came to market in good volume and quality. A long unbroken fair period in the middle part of the month afforded opportunity to complete apple and cranberry harvests, both of which were of better than average yield and condition. The final week produced a couple of energetic storms - that of the 28th brought premature moderate snowfall in all except southern and coastal areas.

November. This was the fourth wettest month of this name in the 64 years of record, though the total was not quite as great as in Nov. 1950. The month opened with a three-day downpour that brought two to four inches of rain, the heavier amounts being in Rhode Island and eastern Mass. Northeast gales and abnormal tides damaged south coastal property. Another storm, this time a "Southeaster" on the 6th, rivalled in destructiveness the near hurricane of the previous November. The middle decade was mild, but thereafter, there were three invasions of cold Canadian air between minor storms.

December. - Again there was a moderate excess of precipitation over the Section. The two-month combination was the greatest in November and December in the past quarter-century. This served to effect a complete restoration of water supplies to the areas such as northeastern Mass., where recent shortages had become alarming to several communities Marked contrast as to temperature, barometric pressure and storminess were presented as a more or less regular succession of low pressure areas passed over the Section every 3 or 4 days. None were of great destructive energy, though the storm of the 14th brought 3 to 11 inches of snow to all except south-coastal parts, and the intense cold that followed aggravated the discomforts. It was, in fact, the most severe and extensive cold-wave of official record so early in the season, a week before the winter solstice.

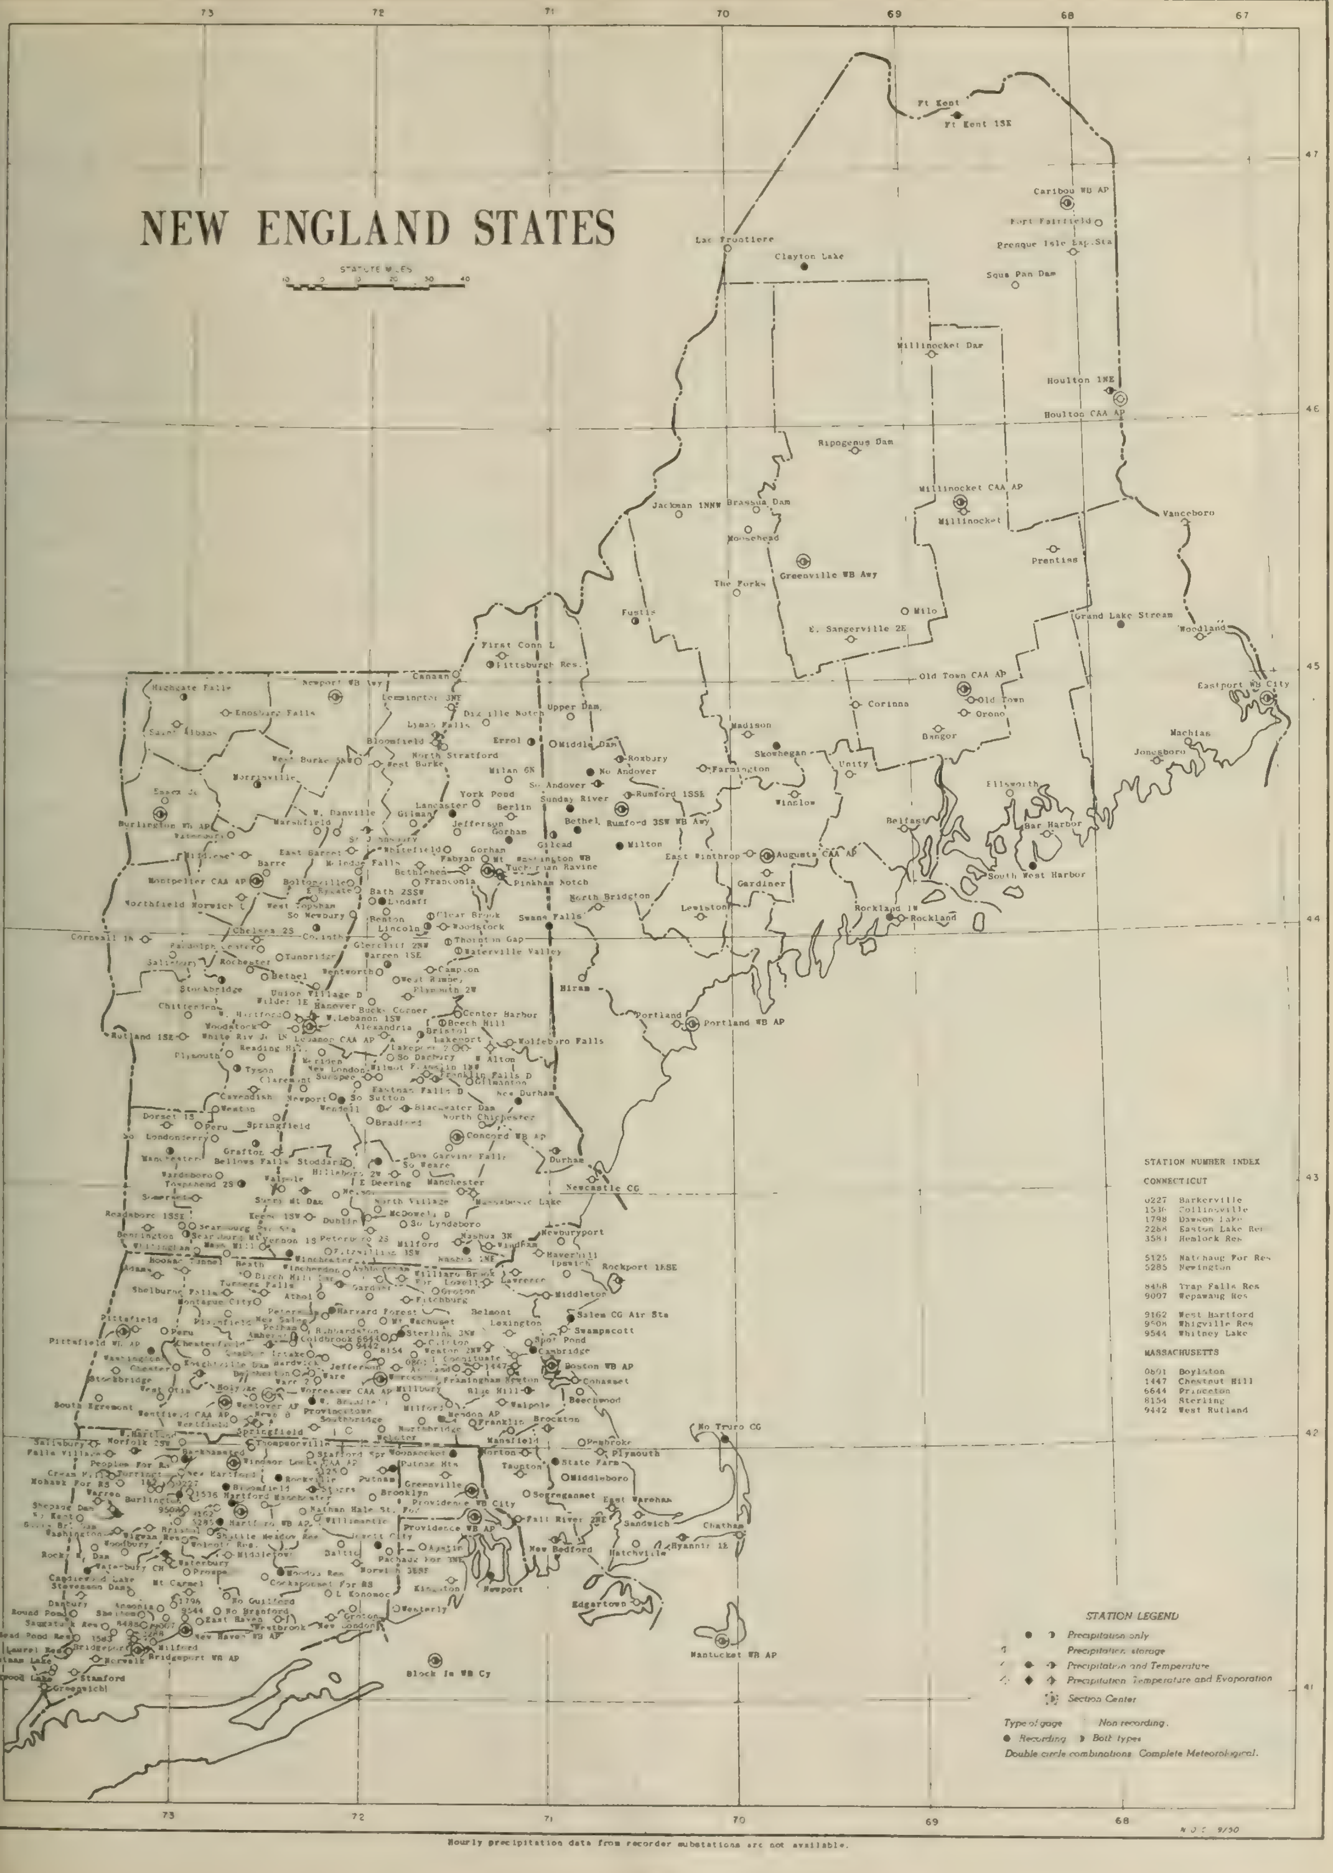
M.T.N.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D. C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.



NEW ENGLAND STATES

Hourly precipitation data from recorder substations are not available.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by foot note following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state. Figures and letters following the station name, such as (2 SSW) indicate distance in miles and direction from the Post Office.

Delayed data and corrections will be carried only in the June and December issues of Climatological Data.

-	No record.
+	Also later date (dates) or months.
*	Amount included in following measurement.
//	Gage is equipped with windshield.
B	Adjusted to full month.
E	Water equivalent of snowfall wholly or partially estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	1 to 9 days' record missing; see monthly Climatological Data for detailed daily record.
R	Station equipped with a recording gage only.
T	Trace, an amount too small to measure.
V	Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1952

NEW ENGLAND - JANUARY 1952

W. H. Tracy, Section Director - Boston, Mass.

WEATHER SUMMARY

Although the average temperature for the month exceeded normal slightly in the Northern Division and substantially in the Southern Division, there were several short periods of typical sub-zero winter severity, in each case giving way quickly to the opposite extreme. While we in New England are prone to expect a "January thaw", in this month there were four such anomalous periods.

In continuation of the general pattern of storm behavior since about December 10, there were, at intervals of two or three days, passages of moderate disturbances moving northeastward from the Lower Plains States with secondary depressions forming near the coast, these soon becoming the principal storms. Temperatures being in the critical range, much of the precipitation was in the form of rain near the southeast coast, and snow north and west of central Massachusetts. Such a storm was that of January 5-6th which produced heavy rain in the southeastern portions but heavy snow in the central and north portions amounting to 14-15 inches. Two days later, an ocean storm developed great intensity two to three hundred miles off the coast, this one bringing 2 to 5 inches of moist snow to Nantucket and Cape Cod. The northeast gales drove heavy surf which damaged coastal roads and installations, even altering the shape of beaches as at Nauset. Power failures were common, as were traffic accidents. There was damage to fishing craft as the 50 to 60-mile gale, with gusts at a 70-mile rate, broke them away from moorings and threw them on the beach. This storm behavior was repeated in a like fashion on the 10th, the 14-15th, 17-18th, and the 22-23rd. In each case, a little snow was deposited changing to rain in the south portion, but with a progressively larger part of the precipitation in the form of snow toward the north. On the 28th, however, frontal precipitation reversed the sequence as cold polar air underran the warm, moist resident air, so that this storm began as rain but changed to snow in all except southeast coastal areas. Following the storm, the polar air continued to flow into and to dominate weather conditions over the Section. Aided by nocturnal radiation over the universal snow surface, temperatures fell on the mornings of the 30-31st to the lowest of the current season, reaching 30 to 40° below zero in northern Maine and New Hampshire - lowest reported -46° at Lac Frontiere, Me. Readings were not quite so low in Vermont. In the Southern Division, they were from zero to -10° away from the coast.

At the end of the month 2 to 4 inches of snow covered the Southern Division, but there was a deep cover in central New Hampshire and Maine ranging from two to three feet. Customary out-door activities, both labor and sport, proceeded with only occasional set-backs. As in the two preceding months, water levels and stream flow were well above normal.

The average temperature based upon the records from 164 stations, was 25.2°, which is 2.6° above the mean for the past 65 years. The highest monthly average reported was 35.8° at North Truro, Mass., and Block Island, R. I. and the lowest was 9.1° at Lac Frontiere, Me. The highest reported was 63° at Waterbury, Conn., on the 26th, and the lowest was -46° at Lac Frontiere, Me., on the 30th. The average monthly precipitation, based on the records of 165 stations, was 4.19 inches, which is 0.76 inch more than the mean for the past 65 years. The greatest monthly amount reported was 8.36 inches at Bar Harbor, Me., the least 1.52 inches at Gilman, Vt. The greatest amount reported in any observational day was 2.09 inches at Prospect, Conn., on the 23rd. The average snowfall for the Section was 16.8 inches, which is 1.1 inches more than the mean for the past 65 years. - M.T.N.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

- - No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND - FEBRUARY 1952

Mark T. Nesmith, Section Director - Boston, Mass.

WEATHER SUMMARY

During the first decade, a succession of disturbances moving eastward near the northern boundary brought frequent rain to the Southern Division and rain or snow to the north. Pressure distribution was such as to prevent any effective invasion of cold Canadian air, and the temperature ranged 10° or more above normal for 11 days. On the 12th, a low pressure area attained considerable intensity off the Massachusetts coast, moved northward, giving Maine, particularly it northeast portion, what was said to have been the heaviest snowfall in 20 years. The extreme northern part of the Stat was sealed off by drifts in places 10 to 20 feet deep. The average amount of new snow was 12 to 30 inches. Greenvill received more than 25 inches, making total depth 43 inches. Cover as much as 4 feet lay over much of the Penobscot Rive headwaters. Communications were disrupted throughout all northern Maine, and amateur radio stations were called upon t transmit emergency messages. Transportation was at a complete standstill.

West and northwest gales in the rear of the storm, with gusts up to an 80 m.p.h. rate buffeted southern New England, damaging homes, signs, trees and power lines. The cold Canadian air that flowed into the Section fortunately lacked extremel low temperatures, and sub-zero minima were rare, but the gales intensified the human discomforts and the stagnation o industry. Two women victims of the winds were treated at Boston City Hospital for bruises incurred when blown off thei feet. Gusts at the 55 m.p.h. rate were noted around Boston, but much stronger gusts wrought widespread damage over Worcester and Middlesex Counties.

By the 14th, the strong, dry northwesterly winds had dried out dead grass and other vegetation to the point of creatio of a real fire hazard, an unusual condition at this time of the year. The Massachusetts State Forest Commission rushe radio equipment out of winter storage to southeastern Massachusetts where some small forest fires were already blazing Observation towers in Barnstable and Plymouth Counties were opened. A fire in Plainville burned over 25 acres. The fir hazard was quickly eliminated by the precipitation of the 16-18th. This storm developed into a "howling northeaster when the center deepened off Nantucket. Heavy snow fell over the entire Section, 3 to 18 inches, the measurements of ne snowfall (though not the water content) increasing with distance inland and northward.

On the 17th, three low pressure areas moved from the Gulf and South Atlantic States northeastward to the vicinity of Nantucket, merging into a single center of great violence. All components productive of heavy precipitation existed, th strong inflow of moist, relatively warm air from the sea, and the cold Canadian air under-running from the northwest Northeast gales and extremely heavy seas split two tankers, one, the "Pendleton", just off Chatham, and the other, th "Fort Mercer", 32 miles east. The crew of the "Pendleton" were rescued by a launch of the Coast Guard, operated by 4 men enacting the latest saga of the sea. One man was fatally injured in the transfer, another was lost overboard from th bow section, and two others were sent to the hospital. The "Fort Mercer" was less fortunate as 4 were swept away in th raging seas during the rescue operation. This storm added one to two and a half feet of new snow to the already dee cover in Maine, so that on the morning of the 19th, depths ranged from 22 inches in the Portland area to 51 inches a Caribou and 50 inches at Greenville, 54 inches at Millinocket, while at North Bridgton, the Observer reported the extraordinary depth of 61 inches. The Rockland Observer stated that it was the greatest snowstorm for 25 years. Traffi was paralyzed state-wide; more than 1500 travellers were marooned, as the 62-mile gale piled up 10 and 12 foot drifts On the most important through Highway of the State, Route 1, 350 cars, busses and trucks were stalled in both lanes i the Biddefort area, the occupants being obliged to spend some 30 hours in a crowded restaurant until rescued by a specia B&M train. At Pinkham Notch, N.H., 39 inches of new snow (4.43 inches water content) fell in the two-day storm of th 17-18th. Approximately 43 persons lost their lives during the storm, most of them from over-exertion combatting the near blizzard. Small-craft, sea-walls, shore highways and installations suffered severely.

Fatalities due wholly or in part to the elements included 5 in Maine, 2 of which were lobstermen, drowned when their boa was swamped in returning from Monhegan Island; 3 in New Hampshire, 6 in Connecticut, and 27 in Massachusetts, includin the 15 lost from the tankers.

Again on the 27th, a coastal storm developed great energy off Nantucket. The average snow measurement on the Island wa 23 inches, but the gales piled up such drifts there, as on Martha's Vineyard and Cape Cod that communication and trave were completely disrupted. Doubtless the heaviest snowfall in that area for more than a half-century, it will go down i history as rivalling the famous blizzard of March 11-14, 1888, which blanketed other parts of southern New England wit 3 to 4 feet of snow. Martha's Vineyard records show no such snowstorm in the past 30 or more years. There was considerabl damage to utilities and many narrow escapes from disaster. In this "Great Storm of '52", the brunt of the heavy snow wa borne by Nantucket, where a 23 inch fall was measured. The 120-ft. Loran tower near Sankaty Head toppled as the wind attained an 80 m.p.h. rate in the gusts. Abnormally high tides damaged several dwellings near Brant Point. At Martha' Vineyard and the mainland from Cape Cod up to Plymouth, there was a 15 to 20-inch cover. The estimates of damage rang from a quarter to a half-million, mostly as cost of repairs and clearing of roads. Ploughing equipment was brought fro the Berkshires, to aid over-taxed local machinery. Some 3,000 autoists were stranded on the lower Cape; most communitie were without power and lights, communications, or transportation.

The month ended on a mild note, but with a 3 to 12 inch snow cover in the Southern Division and 1 to 5 feet in the Norther Division. Stream flow, in response to generous precipitation, continued above normal. Ground-water levels began to decline, but were still normal or above. The average temperature, based upon the records from 161 stations, was 26.3°, whic is 3.5° above the mean for the past 65 years. The highest monthly average reported was 35.6° at New Bedford, Mass., an the lowest was 14.3° at Lac Frontiere, Me. The highest reported was 55° at Hyannis 1 E, Mass. on the 4th, and the lowes was -27° at Lac Frontiere, Me., on the 8th.

The average monthly precipitation, based on the records of 165 stations, was 3.60 inches, which is 0.53 inch more than th mean for the past 65 years. The greatest monthly amount reported was 8.07 inches at Nantucket, Mass.; the least was 1.3 inches at Hardwick, Mass. The greatest amount reported in any observational day was 4.00 inches at Pinkham Notch, N.H. on the 18th. The average snowfall for the Section was 27.0 inches, which is 10.4 inches more than the mean for the pas 65 years. - M.T.N.

SUPPLEMENTAL DATA

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E S.T.

- - No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates
- * Amount included in following measurement, time distribution unknown.
- ./ Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND - MARCH 1952

Mark T. Nesmith, Section Director - Boston, Mass.

WEATHER SUMMARY

In keeping with the usual procedure in this month of transition, the general daily march of temperature advanced 10 to 15°, maintaining a slight excess as compared with normal throughout the greater part of the month. The frequent storms and the lack of sunshine, combined with the many days of raw, coastal dampness, gave a popular impression of a laggard winter, not thoroughly dispelled until the beautiful spring weather of the final week. No marked extremes of temperature were recorded however. During the first 20 days, a series of coastal storms passed northeastward at 3 to 4-day intervals. Winds in these storms were mostly northeast or east and the common pattern of wet snow or rain in southern and eastern New England and snow in the interior and to the north continued The deepest snow cover of the season was during the first decade. By the 5th, with the persistent accretions, depths of 35 to 45 inches were common from central New Hampshire northward and eastward, the area of greatest accumulation being in Cumberland County, Maine. The North Bridgton Observer reported the extraordinary depth of 60 inches on the 5th. In the Winnipesaukee Lake region of New Hampshire, the cover was 3 feet or more, causing some damage by collapsing roofs None of these storms were of violence, though substantial precipitation commonly occurred on the 1st, 5th, 8th, 11th, 14th and 19th, thus maintaining in the Southern Division the above normal periodic pattern that began last October and persisted throughout the entire Winter. In parts of eastern Maine, however, the monthly totals were an inch or less at some stations, contrasting with the more than 5-inch rainfall totals in Rhode Island. The mountain areas and central and northern Maine lost little of their deep snow cover until the third week, and then began to deplete in orderly process with little serious flood threat in the major valley.

Barring any extensive periods of heavy rains and abnormal melting rates, such flood disasters as occurred in the 30's may largely be averted by the flood control systems developed over recent years. Bankfull stages and lowland floodings endanger valley industries, but thus far the orderly reduction of the deep snow cover in the headwaters has not threatened urban areas.

The storm of the 5th, which was accompanied over a wide area by thunder, lightning and hail caused some local property damage. The storm of the 11th was preceded in its northeastward passage by a severe squall-line which hit the Berkshire area harder than along the coast. The gusts tore away roofing, signs and tree branches, fouling some utility lines. In Boston, the barometric pressure fell 1.10 inches in 18 hours, to 29.11 inches (985.3 MBS), the lowest reading since last April Lightning ripped into the Lexington, Mass. water system standpipe, releasing about a million gallons of water. Up to 9 inches of snow fell in northern sections, adding to the already deep snow cover Later storms, though disagreeable, were not active enough to threaten life or property, and were easily forgotten in the bountiful spring sunshine after the 24th.

Winter sports activities were benefitted by the extension of favorable weather conditions. This now important industry has survived with difficulty the vicissitudes of three recent seasons of inadequate snowfall, and the current advantageous long season has been doubly welcome to recoup former losses.

Maple sugar tapping, starting just after the middle of the month in northern areas, accelerated as the weather induced rapid sap runs toward the end of the month. Little snow remained in the Southern Division by the last week, but in the mountains of Vermont, and in New Hampshire from the Winnipesaukee Region northward, and in deep interior Maine areas, depths of one to four feet were common.

The Section average temperature, based upon the records of 161 stations, was 32.6°, which is 0.2° above the mean for the past 65 years. The highest monthly mean reported was 40.9° at Provincetown Mass.; the lowest was 24.2° at Lac Frontiere, Me. The highest recorded was 68° at Waterbury, Conn. on the 21st and Provincetown, Mass., on the 26th; the lowest -22° at Lac Frontiere, Me., on the 2d The average precipitation for the Section, based upon the records of 162 stations, was 3.02 inches which is 0.56 inch less than the mean for the past 65 years. The greatest monthly amount reported was 5.90 inches at Derby, Conn.; the least 0.55 inch at Fort Kent, Me. The greatest amount in 24 hours was 2.88 inches at Round Pond, Conn., on the 11th.

The average snowfall for the Section was 9.7 inches, which is 1.4 inches less than the mean for the past 65 years. - M. T. N.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue

Unless otherwise indicated, dimensional units used in this bulletin are. temperatures in °F , precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E.S.T.

- - No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- / Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1952

NEW ENGLAND - APRIL 1952

Mark T. Nesmith, Section Director - Boston, Mass.

WEATHER SUMMARY

A singularly quiet month over the entire Section. Although the general level of temperature ranged from 3 to 6 degrees above normal for the first three weeks, there was no unseasonable warmth. This factor, in conjunction with the light and scattered rainfall, with generous sunny periods intervening, furthered reduction of the deep snow cover with its heavy water content in the headwaters of the major river systems. Other than the usual spring freshets there was little flooding of dangerous character. Only riverside installations and intervale agricultural lands suffered losses. By good fortune the runoff continued heavy but steady, and by mid-month the potential threat had greatly diminished.

Precipitation totals were well above normal over western and central Connecticut. Some of the Berkshire Reservoir stations and the Hoosatonic Valley received over eight inches. Thence northward and northeastward through southern Vermont and southern New Hampshire, with totals of four to five inches, there was a moderate excess, though less pronounced. In the interior parts of Maine, however, there continued the cycle of sub-normal rainfall, particularly in the Kennebec and Penobscot Basins, a most fortunate circumstance in view of the deep snow cover. Ground water storage continued well above normal except in the southeast portions, a favorable factor for the beginning of the growing season. There was a seasonal increase in reservoir storage to above normal levels.

The weather was also highly favorable to awakening plant life. The ground was well conditioned by early disappearance of frost and by ample deep moisture content. In the third week bountiful sunshine and low humidity (as low as 15% at the Section Center on the 15th) dried surface soils to workable friability in the Southern Division. Maple sugar tapping started a little early and was mostly completed by the 10th, with good quality and quantity indicated. Ideal weather for cranberry plant development advanced buds earlier than usual. Sanding operations were completed by the end of the month. Lumbering and other woods activities were hampered by deep snow at first and then mud in the first decade: improvement of back roads was rapid thereafter. The dry, sunny weather, though a boon to farmers, and providential in almost removing the flood threat, brought hazard of entirely different but no less serious nature. On the 19th, 20th and 21st fires sprang up in dozens of localities in all six states. Driven by dry and gusty southwest and west winds over explosively sere underbrush and forest floor, the wildland blazes swiftly went out of control, and weary firefighters battled from sunrise to sunset to check the spread of destruction. In Maine, despite the fact that inland forests still had a snow cover, numerous fires endangered homes, destroying seven, mostly in the vicinity of Brunswick and Hampden. New Hampshire and Vermont were not so hard hit, but all of southern New England suffered woodland losses. In Tyringham, Mass., a spectacular forest fire levelled the half-million dollar Georgian mansion of the Tytus Estate. In Rhode Island, State fire officials said the epidemic of woodland blazes was the worst in their memory. In Massachusetts there were dozens of outbreaks, consuming 40 to 500 acres. One in Wilmington and Reading was fought by departments from 17 towns. Many homes were endangered: several men suffered burns or smoke inhalation.

Per contra, the final six days brought a reversion to raw and disagreeable winds off the ocean, strong at times along the coast, where heavy rains occurred, making it difficult to realize that the month as a whole was some 3° warmer than normal.

The Section average temperature, based on the records of 157 stations, was 46.4°, which is 2.7° above the mean for the past 65 years. The highest monthly mean reported was 54.6° at Waterbury City Hall, Conn.; the lowest was 37.6° at Caribou, Me. The highest recorded was 84° at three stations on the 20th; the lowest 9° at Fort Kent 1 SE, Me., on the 1st.

The average precipitation for the Section, based upon the records of 160 stations, was 3.98 inches, which is 0.62 inch more than the mean for the past 65 years. The greatest monthly amount reported was 9.26 inches at Wolcott Reservoir, Conn., the least 1.37 inches at Old Town, Me. The greatest amount in 24 hours was 3.25 inches at Danbury, Conn., on the 5th.

The average snowfall for the Section was 0.4 inch, which is 3.5 inches less than the mean for the past 65 years. - M.T.N.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state

Figures and letters following the station name such as 12 SSW, indicate distance in miles and direction from the post office

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables are either missing or received too late to be included in this issue

Unless otherwise indicated dimensional units used in this bulletin are temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3 5 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P M E S.T.

- - No record in Tables 3, 6 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- → And also on a later date or dates
- * Amount included in following measurement, time distribution unknown.
- Gage is equipped with a windshield
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing, see Table 5 for detailed daily record Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage All other data in Table 3 are from non-recording gages.
- S Storage precipitation station Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace an amount too small to measure.
- V Includes total for previous month.

Subscription Price 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office Washington 25, D. C.

NEW ENGLAND - MAY 1952

Mark T. Nesmith, Section Director - Boston, Mass.

WEATHER SUMMARY

Seldom do the principal weather elements, temperature and precipitation, adhere s persistently near to normal as during May, 1952. Not until the 28th was there a da with maximum temperature generally in the 80's. Ordinarily in May there are severa such days and sometimes a day with over 90°. In southern New England, on the othe hand, there were but few unusually cold nights-along the coast only one, on the 5th with minimum below 40°, showing the tempering effect of the nearby ocean. Durin the first eight days lowlands of the interior, even in southernmost parts of Ne England, had several frosty nights, recurring on the 17th. The cranberry region o southeastern Massachusetts had some frost in the bogs that were not protected. Norther New England, away from the coast, naturally experienced some nights of surface freezing.

Showers were frequent after the 9th. On the 11-12th there was a heavy general rai with total exceeding two inches at some stations in each State. This was a typica spring easterly storm, with strong coastal winds. It definitely relieved a fir hazard which had developed in the Southern Division, and the remainder of the mont was free of the fire outbreaks in wildlands, so common in the spring. Coastal wind in this storm attained a rate near 48 mph., with gusts at better than a 50-mile rate No marine damage was reported. Few pleasure craft were in commission, and othe small craft remained in port.

Sunshine in the intervals between rainy periods was not lacking, and nearly measure up to the normal total duration for the month. The ground remained, however, i moist condition, so much so that lowland plantings were delayed, and considerabl replanting was necessary because of seeds rotting in the ground or failing to germinate, particularly true of corn and beans. The grasses and foliage in general throve with excellent prospects of a fine hay crop and good pasturage, a boon to all phase of the dairy industry, and a partial compensation for the backwardness of the plantings of small vegetables.

In the late afternoon and early evening of the 29th local thunderstorms swept acros southern New Hampshire and northeastern Massachusetts. Lightning did scattered damag to buildings in the towns in the valleys of the Concord and Merrimack Rivers in northern Middlesex County. In Bedford and Danvers hail described "as big as marbles whitened the ground and damaged leafage. The frequent showers after the 9th favore the maintenance of high reservoir and stream levels. Ground water supplies wer generally well above normal, though seasonal declines were noted.

The average temperature, based upon the records of 158 stations, was 52.9°, which i 2.2° below the mean for the past 65 years. The highest monthly average reported wa 58.9° at Waterbury, Conn., and the lowest was 45.6° at First Connecticut Lake, N. H The highest reported was 90° at Old Town, Me., on the 24th, and the lowest 19° a Fabyan, N. H., on the 2nd.

The average monthly precipitation based upon the records of 161 stations, was 4.1 which is 0.66 inches more than the mean for the past 65 years. The greatest monthl amount reported was 8.03 inches at Norwalk, Conn., and the least 2.00 inches at Prentiss, Me. The greatest amount in 24 hours was 3.45 inches at Norwalk, Conn., on th 25th. - M.T.N.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW indicate distance in miles and direction from the post office

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables are either missing or received too late to be included in this issue

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F., precipitation and evaporation in inches, and wind movement in miles Degree days are based on a daily average of 65°F Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M. E S.T

- - No record in Tables 3, 6, 7, and the Station index No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain
- E Water equivalent of snowfall wholly or partly estimated using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gages.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price. 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND - JUNE 1952

Mark T. Nesmith, Section Director - Boston, Massachusetts

WEATHER SUMMARY

The month was characterized by temperatures which averaged above normal and were climaxed in most places by the exceptional heat of the 26th; by above-normal precipitation, particularly heavy in Vermont where excessive rains on the 1st and 2nd produced local flooding; and by numerous showers and thunderstorms interspersed among pleasant days with ample sunshine. Especially severe thunderstorms were noted on the 10th, 17th and 26th.

Temperatures generally averaged considerably above June normals throughout the Section except in the northern portion of Vermont where near to slightly below normal values prevailed. Plus departures were greatest along eastern and southern coastal sections, decreasing thence inland towards the northwest. Monthly precipitation amounts averaged well above normal as well, excepting the southeast corner of the Section. Rhode Island was below normal, and Cape Cod and the islands offshore received much less than their expected June rainfall. By contrast, southern Vermont and the adjoining region of western Massachusetts averaged much above their normal monthly precipitation.

On May 31-June 1, a low pressure center developed in the Cape Hatteras area and moved northward, then northeastward, up the Middle Atlantic coast. By the afternoon of the 2nd it was well out to sea southeast of Cape Cod. This coastal development, in conjunction with a low pressure trough simultaneously moving eastward across New England, brought generally heavy rain to the Section. On the 1st, torrential showers produced flash floods, mainly in New Hampshire and Vermont. Streams rose rapidly during the afternoon and night. Highways were blocked by water or by landslides; communications were disrupted; power and light services suspended in many communities. The district most seriously affected was north-central Vermont, where two to four inches of rain fell within a few hours on already saturated valley soils and high stream levels. Many families were removed from flood-threatened dwellings in Orange, Caledonia, Washington and Orleans Counties. A score of towns were partially evacuated; ten major highways closed; fifteen bridges washed out. At Ludlow in Windsor Co., the American Red Cross reported sixty homes damaged by flood waters of the Black River. In Montpelier a gate on the Winooski River was dynamited to prevent a major inundation of the business area. At Hartford, Conn., the Connecticut River rose above flood stage on the 1st, with flash flooding of local small streams; the river crested at 22.2 feet on the 4th, the highest stage on record for June. Three lives were lost in the storm and floods, while property damage, though vast, has not been reliably estimated.

The next damaging storms occurred on the 10th. Lightning and hail damage was suffered in Greater Boston and most of Middlesex County, Mass. A $500,000 crop loss was reported by the Market Gardeners' Association. Numerous though relatively small losses were sustained by homes damaged by lightning and ensuing fires. Twelve persons were injured in auto accidents on hail-slicked streets. Another hard-hit area was Addison County, Vermont, where apple orchards suffered a 25% loss.

On the 17th, showers and thunderstorms widely varied as to time and place of occurrence caused widespread damage over the Section, with greatest havoc in Vermont and Massachusetts. In the morning, violent thunderstorms struck Greater Boston, southeastern Massachusetts and Cape Cod, producing considerable property losses. Due to excessive rain and high water more than $25,000 damage was done to goods in stores at Provincetown. In the afternoon, another set of electrical storms caused losses unofficially estimated at $500,000 in Vermont and the Berkshires of Massachusetts. Telephone and power services were disrupted; fifty trees were blown down in Pittsfield; the North Adams-Williamstown area was pounded by rain, hail and powerful winds.

As a climax to over three weeks of daily temperatures predominantly above-average, on the 26th most of the Section experienced exceptional heat. In Maine, only a few stations reported readings higher than the 80s, but elsewhere in New England maxima of 90° and above were common and some stations even reached 100°. Boston's 100° set a new local monthly temperature mark, as did Hartford's 100° and Providence's 101°. The intense heat was responsible for at least seven deaths and scores of heat prostration cases. Relief came that evening and night to southern New England, which had suffered most, as a cool Canadian air mass moved down to replace the tropical air. A longed-for drop in temperature and an unwelcome band of severe thunderstorms marked its southward progress over the Section. Portland, Maine, had heavy rain and 3-inch hailstones, and many other stations reported severe electrical storms. Squall winds capsized twenty small craft off the Boston shore but fortunately no deaths were reported. Lightning took two lives in New England and caused fires to dwellings and farm buildings, while high winds toppled trees and pulled down utility wires in many areas. Unofficial and incomplete reports of property damage amounted to about $40,000. Spectacular lightning effects and vivid sunset coloration were noted by several observers on the same date. The last four days of the month brought a quiet close, with generally cool and pleasant weather.

On the whole, June was favorable to agricultural pursuits. Warm temperatures, adequate sunshine and ample rainfall caused most crops to make good headway. Ground-water levels, though declining seasonally, continued high for the time of year except in northeastern Massachusetts. Reservoir levels ran a little above normal throughout the Section. Stream flow, reflecting the heavy rains of the 1st and 2nd in the headwaters, was above normal in the early part but receded considerably during the remainder of the month.

The Section average temperature, based on the records of 162 stations, was 65.9°, which is 1.8° above the monthly mean averaged for the past 65 years. The highest monthly mean recorded was 73.0° at Waterbury City Hall, Conn.; the lowest was 57.9° at Eastport, Me., Weather Bureau Office. The highest temperature reading was 102° at Stamford, Conn., Plymouth and Westover Field, Mass., all on the 26th; the lowest was 32° at First Connecticut Lake, N. H., on the 21st. The average precipitation, based on 164 reporting stations, was 4.65 inches, or 1.12 inches above the 65-year mean. The greatest monthly amount was 8.86 inches at West Danville, Vt., and the least 0.66 inch at the Weather Bureau Airport Station, Nantucket, Mass. Noteworthy was the average Vermont rainfall of 6.33 inches, which was 2.59 inches above normal and the highest value for the State in any June since 7.98 inches was received in 1922. - J.K.McG.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated dimensional units used in this bulletin are temperatures in F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non recording gages, unless otherwise indicated.

Data in Tables 3 5 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 P.M E.S.T.

- - No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry
- †† Mount Washington WB New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates
- * Amount included in following measurement, time distribution unknown.
- Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- F Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July, August and December issues of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price 15 cents per copy monthly and annual, $1 50 per year. (Yearly subscription includes the Annual Summary) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1952

NEW ENGLAND - JULY 1952

James K. McGuire, Section Director, Boston, Mass.

WEATHER SUMMARY

July 1952 inscribed a hot and arid page in the weather annals of New England. Its intense heat and dryness reached record-shattering proportions and inflicted disastrous agricultural losses, patricularly in Massachusetts and Maine. As regards temperature, the month attained the highest average temperature of any month of record, exceeding by 0.2° the previous mark of 72.6° set by July 1911. It was remarkable at most observing stations for monthly average readings ranging much above normal and for an unusually large number of days with maximum temperatures of 90° and above. The beginning and end of the month were marked by comparatively cool conditions; except for a similar brief spell about the 10th, however, the main run of weather during the month was characterized by sustained high temperatures, with three rather-evenly spaced crests of heat about the 7th, 14th and 23rd. Combined with the extreme temperature regime, and cooperating to wreak widespread crop losses, was a general deficiency of rainfall. The Section's average precipitation was the second-lowest for any July of record, close to the all-time monthly low of 1.78 inches received in July 1929. For heat and dryness, therefore, the past month surpasses any previous July of record, the only comparable Julys being those of 1949, 1917 and 1910.

The western belt fared not-too-badly as regards rainfall in comparison with the major portion of New England, especially the eastern and southeastern sectors where a number of stations reported a mere few hundredths of an inch during the entire month. Massachusetts, New Hampshire and Maine were designated "disaster areas" by the U. S. Department of Agriculture to permit drought-stricken farmers to apply for special loans. Along with crop failures and browning of pastures went a serious fire hazard. State forests in Maine and Massachusetts had to be closed, and in both states numerous woods-fires occurred. Agricultural losses were of such scope and magnitude that dollars-and-cents estimation is impossible, but a multi-million dollar price tag must be charged to the dire lack of rainfall.

Hot, dry, sunny weather predominated during the month, and the usual summertime showers and thunderstorms were conspicuous by their rarity. This fact bore a favorable aspect, however, in that such conditions were ideal for New England's tourists and vacationers; more importantly, they resulted in only three severe local storms being reported during July. The first of these flung violent winds on the lower St. Croix Valley district in extreme northeastern Maine on the early evening of the 14th, wreaking $25,000 property damage in Eastport and an estimated equal amount to crops and property elsewhere in the area affected. A one-minute wind velocity of 61 mph was recorded at the Weather Bureau station in Eastport, with even stronger gusts, in the course of a violent thunderstorm characterized as one of the worst summer storms experienced in the locality. On the morning of the 27th, a line-squall developed over the northeastern corner of Massachusetts and swept rapidly out to sea along a path approximately twenty miles long and ten miles wide. Hardest hit by the furious winds were communities near and along the coast of Essex Co. Trees, electricity and telephone poles were toppled in great numbers; highways blocked; considerable wind damage to buildings reported. In Salem Harbor and adjoining coastal waters, an estimated 200 small craft were capsized, causing many narrow escapes and five deaths by drowning. The U. S. Coast Guard Air Station at Salem estimated wind gusts at 85 mph, while press reports placed storm losses in the vicinity of $1,000,000. The third severe local storm of the month struck Franklin Co., Mass., on the late afternoon of the 31st. An intense thunderstorm, with tornadic action reported, it brought hail, rain and estimated 80 mph winds which concentrated destruction in and around the town of Whatley. There, tobacco and other crops were riddled by hail, trees blown down and four barns destroyed over an area less than a mile square, with total losses estimated at about $25,000.

The month's weather pattern began with a high pressure system drifting southeastward from Quebec to a central position off the Middle Atlantic coast on the 3rd. Its associated air flow brought either the lowest or closest to the lowest temperatures of the month to many stations, along with fair weather. This situation was replaced by cloudy, showery conditions on the 4-5th, when a low pressure trough swept eastward, but another HIGH with fair weather followed in its wake, bringing an upsurge of temperature and dominating the Section until the 8th. This weather sequence of alternating LOW and HIGH was then repeated, though the next low pressure trough stagnated over New England on the 10-11th, causing somewhat cooler weather and general showers which were heavy in some western locations. This indication of a slowing down in the movement of the pressure system was confirmed by the behavior of the subsequent HIGH which continued as the Section's principal weather control until the 19th while it lingered first over the Central Appalachains and then shifted its center off the Middle Atlantic coast. The circulation attending this high pressure cell sent warm air from the south streaming northeastward, then eastward, into New England, producing especially high temperatures on the 14-15th. Only light, scattered showers generally occurred from the 12th to the 18th. Next, a low pressure trough entered from the north and affected the Section until the 23rd. Showers, in the main light, were fairly frequent during this period, but the prevalent hot weather was not interrupted. A persistent high pressure center over the Gulf of Mexico kept feeding warm air northward into the low pressure hovering about New England. Indeed, on the 23rd, the month's heat reached its climax over most of the Section, with 90°+ readings extending into northern Maine, 100° registered at Boston and temperatures up to 102° at several other stations. The last week of July saw more rapid changes in the surface pressure systems, but rainfall continued disappointingly light and temperatures generally above normal, except for a cool interval about the 30th, on which date a number of stations marked their lowest readings for the month. Throughout, the major weather features for the month, not only with regard to New England but also practically the eastern third of the nation, were such as to induce prevalent atmospheric flow of warm air, with relatively little shower activity and few, if any, areas of general rainfall, so that New England's dry July was part of a large-scale tendency during the month towards sub-normal precipitation over a major segment of the country.

Since reservoir storage was high and ground-water levels near normal in June, water supply in the Section was not as critically affected by the July dry spell as might otherwise have been the case. Runoff was predominantly deficient, but minimum flows were generally well above past minima; ground-water levels, though declining, were mostly in the normal seasonal range and reservoirs did not reach seriously low stages.

The Section's average temperature, based on the records of 163 stations, was 72.8°, or 3.6° above the July mean for the past 65 years, and the highest monthly average temperature reported was 78.6° at Waterbury City Hall, Conn.; the lowest was 64.3° at Somerset, Vt. The highest daily temperature recorded during the month was 102°, at Old Town, Me. on the 7th and at Lexington and Lowell, Mass., on the 23rd. The lowest was 32° at Jackman, Me., on the 30th.

The average precipitation for the Section, based upon the records of 169 stations, was 1.85 inches, which is 1.87 inches below the 65-year July mean and the second lowest amount on record for the month. Maine received only 29% of normal monthly precipitation, Massachusetts 39%, and Rhode Island a mere 14%; the other states were somewhat better off, Connecticut receiving 72%, Vermont 70% and New Hampshire 66%. As mentioned above, the western portion of the Section generally experienced higher rainfall amounts than the eastern and southeastern districts. The greatest monthly amount reported from any station was 6.06 inches at Easton Lake Reservoir, Conn.; the least 0.02 inch at New Bedford, Mass. The greatest 24-hour amount was 4.10 inches, measured on the 11th at Springfield, Vt. - JKMcG

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 A.M. E.S.T.

- - No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July, August and December issues of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1952

NEW ENGLAND - AUGUST 1952

James K. McGuire, Section Director - Boston, Mass.

WEATHER SUMMARY

After the extreme heat and dryness of July, August seemed by comparison an agreeable summer month. This impression was engendered by the above-normal rainfall of the first seventeen days, which relieved the July "drought" over most parts of New England and, though accompanied by above-normal temperatures, was not marked by the torrid conditions that made the previous month so unpleasant. It was confirmed, in a different way, by the contrasting type of weather experienced during the second half of August: less rainy and less uniform in temperature, bringing two cool spells and the one sustained "heat wave" of the month. August was therefore, on the whole, favorable for agriculture and customary summertime activities. Crops and pastures made rather good recovery, though more rain would have been welcome in Northern Maine. Only one day with severe local storms occurred, the 5th, which in Boston was noteworthy for record-breaking intensity of rainfall for 10 and 30 minute intervals. When the record books were checked and closed for the month, they showed temperatures averaging 1.4° above the long-term August normal in northern New England, about 1° above in the southern division. Rainfall averaged above normal for the entire Section, though it was much higher in the three southern states than over the northern division, where generally below normal amounts prevailed.

The surface weather map, through the first 17 days of the month, was marked by vigorous activity as a series of rapidly moving and rather complex low pressure systems affected New England. This activity not only contrasted sharply with the generally slow-moving and largely high-pressure controls of the previous month, but also brought copious and almost daily rainfall. Thus most of the section received gratifying relief from July's extreme dryness. Moderate to heavy precipitation fell over Southern New England on the 2nd; the periods of the 5-6th and 10-11th witnessed general rainstorms with amounts tapering from heavy over Connecticut to light in Northern Maine; the 16-17th brought widespread heavy rains. These "high spots" established the month's pattern of above-normal precipitation in the three southern states and below-normal in the northern areas. The same 17 day period showed prevailing above-normal temperatures, with greatest departures about the 3-5th and 11-15th. Maximum readings ranged generally in the middle and upper 80's, except near 80 at some coastal and mountain stations.

After the 17th, the overall weather trend changed significantly. The alteration was reflected in both the precipitation and temperature regimes. Rainfall occurrences and intensities decreased notably. From the 18th through the 28th, an area of high pressure dominated New England's weather, bringing little in the way of rainfall except for good amounts on the 21-22nd that were due mainly to a coastal LOW. A trough dropped down from Canada on the 29th, accompanied by light to moderate precipitation over most of the section. Temperature-wise, the latter half of the month divided itself into three periods, with a generally warm interval between two prevailingly cool spells: a rythm quite unlike that of the first seventeen days. The first cool period lasted from the 18th to the 25th, bringing general below-normal temperatures. A large HIGH, centered over Lower Michigan on the 18th, drifted eastward across New England and passed out to sea on the 21st. On the 19-20th, its orientation was such that cool Canadian air poured southward, dropping temperatures close to 40 degrees over northern New England. A second wave of cool air followed on the 23-25th, caused by the northerly circulation around a new HIGH which, centered over Lake Superior on the 22nd, moved slowly southeastward during the subsequent week. The 24th was notable at many stations for the coldest weather of the month. Then, as the center of the HIGH passed off the Middle Atlantic Coast, establishing a southerly flow over New England, a swing to above-normal temperatures occurred. Readings in the 90's were widespread from the 26th to the 29th, so that highest monthly readings were reported at many stations only a few days after the minima occurred. The pendulum swung back again on the last two days of August, following the entrance of cool air from the north. Readings generally in the 40's were reported from northern New England, in the 50's from the three southern states, and 32° was touched at Millinocket, Me.

In association with a squall-line moving eastward across Southern New England on the 5th, general thunderstorm activity during the afternoon and evening produced severe local storms. Most reports of damage centered around (1) Greater Boston, Mass., (2) Amherst and Milford, N. H., (3) Hartford, Conn., and (4) northeastern Connecticut and central Rhode Island. Aside from $2,000 losses from strong winds in the Amherst-Milford area, practically all damage came from lightning-caused fires. Crop losses were trifling. In Greater Boston, numerous small losses to property approximated $20,000; widespread utility and telephone breakdowns occurred; intense rain flooded streets and halted surface transportation; one death and two injuries were attributed to the storm. In and around Hartford, Conn., estimated $50,000 property losses from lightning-fires in barns and dwellings were reported, with four persons struck by lightning but not seriously injured. At Pomfret, Conn., a $25,000 barn fire occurred. In the Coventry - West Warwick area of Rhode Island, 4 injuries from lightning and small property losses totalling $5,000 were reported.

Reflecting the month's precipitation pattern, there was a great disparity between the northern and southern parts of New England in the matter of stream flow, ground-water and reservoir levels. Reservoir storage declined slightly during the month, but was generally close to or slightly below normal. With this exception, water supplies improved in the southern division and continued deficient in the northern. Runoff was excessive in Connecticut, decreasing thence northward to considerably below normal in Maine and upper Vermont and New Hampshire. Similarly, ground-water levels showed a net rise over Massachusetts, Rhode Island, Connecticut and the southern parts of Vermont and New Hampshire, but declined to below average elsewhere in the Section.

The average temperature for the Section, based upon the records of 163 stations, was 68.2°, or 1.0° above the August mean for the past 65 years. The highest monthly average reported was 72.8° at Bridgeport, Connecticut, Chestnut Hill, Massachusetts, and Providence, Rhode Island; the lowest was 60.8° at Somerset, Vermont. The highest temperature recorded was 100° at Old Town, Maine, on the 28th; the lowest, 32° at Millinocket, Maine, on the 31st.

The average precipitation for the Section, based upon the records of 165 stations, was 4.82 inches, or 1.13 inches above the 65-year August mean. This average conceals a great disparity between the heavy rainfall received over the southern division (Massachusetts, Rhode Island, Connecticut) and the below normal amounts general in the northern division (Maine, New Hampshire, Vermont). The average for the northern division was 2.83 inches, or 0.64 inches below the 65-year mean, with all three states showing a deficiency. In sharp contrast, the average for the three southern states was 7.04 inches, which was 3.15 inches above the long-term mean. The greatest monthly amount reported was 13.56 inches at Kingston, R.I.; the lowest, 0.85 inches at Madison, Maine. Greatest amount in 24 hours was 4.80 inches, measured at Groton, Connecticut, on the 6th. - J.K. McG.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 A.M. E.S.T.

- - No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M 1 to 9 days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July, August and December issues of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND - SEPTEMBER 1952

James K. McGuire, Section Director - Boston, Mass.

WEATHER SUMMARY

Weather follows the sun and obeys, but not slavishly, the astronomical seasons. Though the autumnal equinox does not come until late in the month, September in New England usually finds Fall in the air. Yet traces of the Summer linger into the month and give it a transitional quality. September 1952 followed this pattern of contrast and change. It averaged out as a warm month, with temperatures about one degree above normal for all states of the Section. Summer-like 80's were common afternoon readings at many places, and even 90° was exceeded at a few. On the other hand, the month had two cold snaps, one early (7-9th) and one late (27-29th), which brought frost to wide areas, with an intermediate dip on the 15th that affected Maine principally. It experienced a dying hurricane (1-2nd), which is an autumnal event; but one day (19th) was marked by thunderstorms fully as severe as those of July or August.

In the prevalence of fair weather, however, September showed a measure of constancy and approximated the type of weather expected of it. Monthly precipitation averaged moderately below normal in all the states except Massachusetts and Rhode Island, where it was considerably below. Sunshine was abundant. September accordingly gave many dry, warm, bright days, ideal for outdoor activity and the harvesting of crops. The deficiency of precipitation was alleviated in the Southern Division by the fact that heavy amounts had been received the previous month. Of the three northern states, which had sub-normal August rainfall, Maine suffered most from lack of moisture. On the balance side of the ledger, conditions favored the harvesting and storage of the State's important potato crop. Growth in most Aroostook County fields was ended by frost on the 8th and 15th, about ten days earlier than usual.

Elsewhere in New England, the month was similarly favorable for harvesting and general agricultural activities. About the only major crop that did not do at least average was the Massachusetts cranberries. Pastures improved considerably, so that milk production maintained a high level despite the ill effects of the June "drought". The Connecticut Valley tobacco crop was harvested in late August and early September under beneficial conditions. Curing made excellent progress during the month with temperatures above normal and rather low relative humidity. The New England apple crop fared well in September; most of the McIntosh variety was picked by October 1st. The peach harvest was below last year but still above average; pears were below both last year and average.

The month began on a stormy note, as the weakened remnant of Hurricane "Able" entered Southern New England early on the 1st and passed northward over Maine on the 2nd. Strong winds (gusts up to 50 m.p.h.) on the 1st were restricted to the southern coast and interior. A few small boats were torn from their moorings and damaged; slight "drops" of fruit and minor crop losses were reported from scattered localities in Connecticut, Rhode Island and Massachusetts; total damage (estimated $5,000) was surprisingly low. Precipitation associated with this disturbance was generally moderate-to-heavy, and accounted at many stations for the major share of the month's precipitation. It spread from southern districts on the 1st to northern localities on the 2nd, and rain came again on the 3rd as a low pressure trough moved eastward over the section. Thus, Labor Day (the 1st) was dampened by rain or the threat of rain, disappointing resort operators and holiday vacationists; but the inclement weather proved a blessing in disguise for home-bound motorists. Cautious driving was the rule, and only five highway fatalities were reported in New England over the entire long weekend.

The period from the 4th through the 14th, by contrast, was one of generally fair weather, with plenty of sunshine. Maine, New Hampshire and Vermont had some light precipitation mostly on the 6th, 10th and 13th, but the Southern Division was practically rain-free up to the 14th.

Temperatures through the first three weeks of the month were prevailingly normal or above, with the exception of a rather severe early-season cold snap on the 7-9th During these three days a mass of cold Canadian air dominated New England. A number of stations reported record-breaking minimum readings for so early in September, and some reported their low for the month at this time. The mercury dipped to 27° in Maine; 28° in New Hampshire; 30's were common in the Northern Division, 40's in the Southern. The first frost of the season occurred on either the 7th or 8th at a number of stations in the Northern Division, and at a few locations in Massachusetts. Among the latter were the cranberry bogs of Plymouth and Barnstable Counties, which suffered some crop losses. The frost was light in almost all reported instances, though a few northern or mountain stations in Maine, New Hampshire and Vermont reported heavy and killing. Conversely, places like Milford and Peterborough, N. H., experienced frost neither during this cold spell nor subsequently during the month, an unusual condition.

Temperatures rose sharply after the 9th, with the result that the majority of New England weather observers recorded their maximum monthly readings during the warm period of 11-13th. At Boston, 90° was recorded on the 13th, tying the record for the date, and Greenwich, Conn., soared to 94°, the month's high in New England. Some stations had already reached their maximum temperatures for the month about the 2nd, and a few in Maine touched their peaks on the 6th. Coming on the heels of the cold snap, however, the widespread warmth of the 11-13th was indeed noteworthy. It was followed by cooler, but generally seasonable temperatures through the 21st.

August's weather pattern had been marked by a shift from frequent rainfall in the first seventeen days to sub-normal precipitation for the remainder of the month. September also showed a change, though in the opposite sense, after the 14th. The last three days of the month were rainless, but the intervening span (15-27th) contrasted with September's first half by reason of increased rainfall activity. Four rather general precipitation periods occurred, centered about the 16th, 19th, 23rd and 26th. Amounts were mostly light throughout, except for scattered heavy downpours on the 19th, with the result that September ended up with a precipitation deficiency over the Section. The rain on the 19th came from showers and from thunderstorms that caused considerable damage in three localities.

Until the 22nd, average daily temperatures continued rather uniformly normal or above, except from the 7th to 9th as mentioned. The remainder of the month, as if to mark the advent of Autumn, behaved in more seasonable fashion, with fluctuating cold and warmth. A combination of high pressure to the south of New England and a LOW over northern Quebec set up a flow of air from the northwest that caused generally below-normal temperatures from the 22nd through the 24th. The next two days brought moderating conditions as the air flow swung around to southwesterly, but a fresh surge of cold air invaded New England on the 27-28th. This pair of days, throughout most of the Section, had the coldest weather of the month. Sub-freezing levels were touched at northern and mountain stations and even at a few Massachusetts spots; light frost was wide-spread, including places untouched during the 7-9th; and, as in that earlier cold snap, a few northern and mountain locations reported heavy or killing frost. Most of Connecticut and Rhode Island, most of the eastern half of Massachusetts, parts of southern New Hampshire and coastal Maine, however, remained frost-free. The last two days of the month brought a temperature upswing. The mercury climbed in the 70's and 80's: Providence, R.I. and Boston, Mass., each reached 88° on the 29th, new records for the date, and Caribou, Maine, touched 78°.

Aside from the relatively negligible damage caused in the Southern Division by the passage of the hurricane remnant on the 1st, just one day in the month was marred by violent weather. This was the 19th. At 1:30 A.M. on that date, the boundary line (or "front") between two opposing air masses lay in a low pressure trough extending from southeastern Canada through Lake Erie and the Ohio Valley. To the east, a warm air current was streaming up from the Gulf; to the west, a cooler northerly current was pushing south and eastward. As the warmer air was forced to retreat into the Atlantic, its zone of conflict with the advancing Canadian air was marked by showers and thunderstorms. This troubled area, extending several hundred miles east of the "front", spread into New England during the early hours. It engulfed the Section for most of the day.

At three places, the band of disturbed atmospheric conditions erupted into damaging local storms. The first was the northern corner of coastal New Hampshire. About 9:30 A.M. (EST), a violent thunderstorm broke out in the North Hampton - Greenland neighborhood. Moving on a northeasterly course, it passed over Portsmouth about fifteem minutes later, and swept out to sea off Kittery Point, Maine, about 10:00 A.M. It wreaked a path of destruction some 500 yards wide and 15 miles long, along which approximately $200,000 damage occurred. No reliable measurement of the wind velocity in this storm was made, but estimates of gusts up to 90 m.p.h. may not be too exaggerated in view of effects of the blow. Indeed, witnesses referred to it as a tornado; but in the absence of any definite reports of the characteristic funnel and in view of the fact that no deaths or injuries were incurred, this description cannot be taken literally. At any rate, the wind was of the magnitude that is generated by exceptionally severe thunderstorms from which tornadoes or near-tornadoes often develop. Most damage was done in Portsmouth, $32,000 to the buildings and grounds of the Naval Shipyard alone. Roofs and chimneys were blown off homes; a garage, barn and ice house were flattened; autos were overturned; porches smashed; trees overblown, blocking streets and damaging parked vehicles. Utility lines were knocked to the ground, and orchards in the vicinity lost considerable fruit. Along the shore, minor damage to small boats and lobster traps occurred.

Neither of the other two local storms on the 19th approached the violence of that at Portsmouth. From about 11:00 A.M. (EST) to noon, Springfield, Mass., and nearby communities were struck by another thunderstorm. Heavy rain fell; wind gusts rose to an estimated 50 m.p.h. One small house fire was caused by lightning, and several dwellings were rain-flooded, but practically all the estimated $10,000 property losses (including minor damage to standing corn) was caused by wind. Three hours later, Putnam, Conn., was storm-stricken. Strong gusts, extending in their undetermined maximum force over a two-minute period, swept along a course about 5 miles long and 1000 yards wide. The path of damage reached northeastward from Pomfret to Thompsonville, and passed through the northern part of Putnam where most of the $25,000 property losses was suffered. Trees were blown down; about 100 dwellings and poultry coops met with mostly minor damages; some corn was uprooted. The largest single bit of destruction came when a section of the grandstand at the Putnam recreation Park was blown away. One woman was cut by flying glass, the only person injured on this day of furious elements.

In the matter of stream-flow and water supply, the month's sub-normal rainfall had unfavorable consequences. Stream-flow continued deficient in Maine; ground-water levels kept on declining during the month so that many farm wells became dry. New Hampshire and Vermont also had generally below average stream-flow and ground-water at September's close. The situation was better throughout the Southern Division, which had received heavy precipitation in August. Water levels were high for the season in Connecticut, Rhode Island and southeastern Massachusetts, and generally above average in the rest of the Bay State. Stream-flow in these states, however, averaged generally below normal. Reservoir storage throughout New England showed a general decline.

The average Section temperature, based on the records of 165 stations, was 61.1° or 0.8° above the 65-year mean. The highest temperature recorded was 94° at Greenwich, Conn., on the 13th; the lowest was 27°, touched at four Maine stations on the 8th and other dates, and at two Vermont stations on the 28th. Highest monthly average temperature was 66.8° at Chestnut Hill, Mass.; lowest was 53.9° at Somerset, Vermont.

The average Section precipitation, based on the records of 171 stations, was 3.03 inches, which was 0.66 inch under the 65-year mean for September. The greatest monthly amount reported was 6.45 inches at Alexandria, N.H., while the lowest was 0.73 inch at Nantucket WB AP, Mass. The highest amount measured in any one observational day was 4.18 inches at Plainfield, Mass., on the 2nd. - J.K.McG.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the above table are in local Standard Time.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 A.M. E.S.T.

- - No record in Tables 3, 6, 7, and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington WB, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M One or more days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July, August and December issues of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

W.R.P.C., Chattanooga, Tenn. --- 11/10/52 --- 1100

CHATTANOOGA: 1952

NEW ENGLAND - OCTOBER 1952

James K. McGuire, Section Director - Boston, Mass.

WEATHER SUMMARY

The month was cool, sunny and dry. Temperatures at most stations averaged 1-3 degrees below normal: after a warm opening week, crisp Autumn weather predominated. For the third consecutive month, precipitation was below normal. Its distribution was such that the northern extremity of Maine received above-normal amounts, but southward over the Section monthly totals decreased sharply. The Southern Division (Massachusetts, Rhode Island and Connecticut) averaged only a little over a third of its normal October precipitation; New Hampshire was also much below normal, while Maine and Vermont averaged moderately below. The greater part of the month's precipitation fell during the first week. It was extremely dry from the 8th on, the paucity of precipitation being accentuated by prevalent low relative humidities and rather windy conditions so that not only did water supplies continue to decline but also the forest fire hazard was rendered acute. Many small blazes occurred, but fortunately no major conflagration.

Aside from the precipitation deficiency, the month's weather was generally pleasant. Only one day - the 2nd - was marred by severe local storms. The 28-29th brought the first important snowstorm of the season. The growing season was terminated in almost all areas by the 21st. Late-season fruits and vegetables were harvested under favorable weather conditions, and tobacco curing progressed satisfactorily. The close of the month found farm work swinging into the winter routine, after a season that had been gravely affected by the July drought.

October's first week had frequent rain and mainly above-normal temperatures. On the 2-3rd, a low pressure trough moved slowly eastward across New England; a separate LOW center formed in this trough over Cape Cod on the 3rd and swept northward through Maine into New Brunswick early the next day. Thus, general moderate-to-heavy rain accompanying widespread thunderstorms prevailed over the Section on the 2-3rd, and rain continued into the 4th over Maine. Amounts tended to be heaviest in the northern reaches of that State: Caribou received 3.23 inches on the 3rd, breaking all previous records at that station for 24-hour precipitation. Another slow-moving trough produced general rainfall on the 5-6th, but light amounts were the rule; thunderstorms and spotty rainfall also occurred on the 7th. Except for a cool spell on the 3-4th, this first week was the warmest of the month. Afternoon readings in the 60's and 70's were common at all but extreme northern and mountain locations, with overnight lows in the 50's generally. Most stations recorded their highest temperature for the month on one or another of these first seven days.

From the 8th on, the weather settled into the month's dominant pattern of subnormal temperature and precipitation. Many stations reported no precipitation, or at least none of any consequence, during the remainder of October; a number of observers in the Southern Division reported this as either the driest or close to the driest October in their local records. The period of the 8-12th was fair and cool: temperatures averaged about 5 degrees below normal and were of the brisk Autumn variety. Frost was observed at a number of stations on the 9th. Rainfall was light and scattered. A coastal LOW, moving northward from Florida, passed east of Cape Cod on the night of the 11-12th; it gave mostly light rain to parts of Southern New England, though Nantucket benefited to the amount of 1.29 inches.

The next four days (13-16th) brought little in the way of precipitation, but witnessed a temperature upswing most pronounced on the 14th. Many stations had readings in the 70's on that afternoon; some reported their monthly maxima; Providence WB City, R. I., reached 81°, the highest for New England during this October.

In contrast, the period of the 17-22nd returned to subnormal temperatures. Two successive onslaughts of cool Canadian air poured over the Section, one coming on the 17th and the other on the 20th. The second was the more severe, and came when a low pressure development over Lake Superior on the 18th swung up the St. Lawrence Valley to a central position over Northern Maine on the early morning of the 20th. Cold north winds followed in the wake of the LOW and prevailed until the 22nd. Very low minimum temperatures for the time of year resulted on the 20th and 21st. Freezing weather was widespread, ending the growing season; some northern and western stations dropped below 20°. A number of stations recorded their lows for the month, and the first killing frost of the season was reported by most of the southern stations that had hitherto escaped. Light rain and some snow accompanied the passage of the LOW preceding this cold snap. Greatest snowfall amounts were in the vicinity of Caribou, Me., which measured a total fall of 3.8 inches on the 19-20th.

The last ten days of the month behaved in similar fashion to the corresponding final period of September. Brief alternating spells of mild and cool weather reflected relatively rapid changes in the atmospheric circulation. Westerly winds on the 23-24th brought above-normal temperatures; then cool air flowed down from the north to produce chilly weather on the 25-26th. At many stations the minimum reading on the morning of the 26th fell below those of the 20-21st, as temperatures ranged well below the freezing mark down to 11° at Fabyan, Me. Portland, Me., had a low of 18° on the 26th, setting a new local minimum record for October and becoming the coldest temperature ever observed there on any day prior to November 11th. The 27th brought a southwesterly circulation and a moderation in temperature, but the morning of the 28th found cold northwesterly winds entering New England behind an eastward-moving low pressure trough. This system produced on the 29th the Section's first general and significant snowfall of the season. Amounts ranged from traces over most of the Southern Division to as high as 11 inches at First Connecticut Lake, N.H. Fair weather followed the snow, with rising temperatures on the 31st; by the end of the month little snow cover was left except in the northwestern mountains.

Thunderstorms were reported by many stations on the 2nd, 3rd and 7th. Those on the 2nd produced damaging local storms in Massachusetts and Connecticut principally. Heavy rains, strong winds and violent lightning activity occurred during the afternoon and evening at communities in New London and Windham Cos., Conn., Worcester and Middlesex Cos., Mass., and at Nashua, N. H., and vicinity. Wind gusts, estimated to be 45-50 m.p.h., uprooted trees and tore down limbs, littering streets and highways. The garage and breezeway of a residence in West Concord, Mass., were blown over. Streets were flooded, notably in Putnam, Conn., where 2.43 inches of rain fell during the storm. Wind and lightning broke utility lines, interrupting telephone and electric service in many places. Lightning also caused damage to the roofs, walls, wiring and chimneys of homes; five occupants of another West Concord dwelling were stunned by a lightning bolt, but not seriously injured. Hail was observed at Putnam, Conn., Mt. Wachuset, Mass., and a few other locations, but caused trifling damage to crops and some broken windows. Total estimated property damage included $500 from rain, $2200 from wind, and $11,000 from lightning.

Two dissimilar phenomena also occurred during the month; earthshocks and persistent smoke in the air. About 5 P.M. on the 14th, light tremors were felt in Northern Maine, being reported by the observers at Fort Kent and Fort Fairfield. Several light shocks came again on the early morning of the 26th, this time being reported from Lakeport and Wolfeboro, N. H. Damage was negligible in both instances. The last few days of the month, especially the 27th and 31st, were marked by smoky atmospheric conditions, caused by woods fires in New England as well as by smoke drifting from forest blazes in other parts of the country.

In general, ground-water levels were above normal in Rhode Island and Massachusetts, about average in Connecticut and Vermont, and below normal in New Hampshire and Maine (except the northern part). Stream flow was below average, again excepting Northern Maine. Over most of New England, reservoir storage declined seasonally to an average of about 10% from September volume to about 50% of capacity and 80% of normal.

The average Section temperature, based on the records of 167 stations, was 47.4°, or 2.3° below the 65-year October mean. This was the lowest average for the month since the 47.8° of October 1945. The highest temperature recorded was 81° at Providence WB City, R. I., on the 14th; the lowest was 11° at Fabyan, N. H., on the 26th. Highest monthly average temperature was 54.6° at North Truro, Mass.; lowest was 39.3° at First Connecticut Lake, N. H.

The average Section precipitation, based on the records of 170 stations, was 1.99 inches. This was 1.40 inches under the 65-year mean for the month. The greatest monthly amount reported was 5.63 inches at Fort Fairfield, Me.; while the lowest was 0.51 inch at Middletown, Conn. The highest amount measured in an observational day was 3.45 inches at West Hartford, Vt., on the 3rd. Average snowfall for the month was 1.3 inches, compared to the 65-year mean of 0.2 inch. Greatest monthly snowfall reported was 14.1 inches at First Connecticut Lake, N. H. - J.K.McG.

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5 and 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 A.M. E.S.T. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

- - No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M One or more days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July, August and December issues of this publication.
- ▬ This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1953

NEW ENGLAND - NOVEMBER 1952

James K. McGuire, Section Director - Boston, Mass.

WEATHER SUMMARY

November continued the trend of the autumn months for deficient precipitation, and ground water supplies continued to decline to well-below-normal levels. Precipitation amounts were near or moderately below normal over most of Connecticut, Western Massachusetts and Southern Vermont. Elsewhere over the Section amounts were generally much below normal, with totals averaging about two inches, except for extreme "Down East" Maine where near-normal precipitation was received. The deficiency would have been exceedingly more acute were it not for the storm of the 22-23rd, which produced the lone heavy rainfall of the month. The other precipitation occurrences, though quite frequent, gave only light to moderate amounts; at many stations the 22-23rd accounted for roughly half of the month's total. Snowfall was below normal, occurring mainly during the periods of the 6-12th and the 27-30th.

Temperatures averaged slightly above normal, with plus departures tending to be higher over interior sections than in areas adjacent to the eastern and southern coasts. The month's temperature trend split into two nearly-equal parts. Except for a warm spell on the first three days, when almost all stations reported their monthly maximum readings, the span from the 1st through the 14th averaged slightly below normal. Thereafter, until a cold snap on the 29th-30th, conditions were persistently much above normal. Low readings for the month were most common on the 9th, 14th and 29-30th, but extended or severe cold weather was conspicuous by its absence.

A mild, dry month, therefore, November brought favorable weather for outdoor activities. Poultry raising and dairy farming interests benefited especially. Agricultural work settled into the winter routine; the low state of farm wells in many parts of New England was a principal concern. Sections of Maine, especially, were troubled by low water supplies. As a redeeming feature, the month had no major periods of bad weather, and no severe storms were reported.

Until the afternoon of the 3rd, fair skies and balmy temperatures prevailed over the Section. Afternoon high readings in the 60's were common, and 70° was exceeded at several places. Then came an abrupt change. An extensive mass of cold air, which had overspread the western half of the United States, pushed its leading edge (or cold front) eastward to the Appalachians on the early morning of the 3rd. The cold front reached the Atlantic by nightfall. A drop in temperature and general light precipitation marked its passage across New England. This was the first of a series of similar cold air outbreaks which swept over the Section at three or four-day intervals during the remainder of the first half of the month. In association with these outbreaks came low pressure systems with their cloudiness and precipitation. As a result, skies tended to be cloudy; rainfall was frequent though generally light; and snow flurries occurred almost daily over western and northern regions from the 6th to the 12th. Temperatures from the 4th to the 14th persisted on the cool side, but not excessively so, since temperatures in the cold air masses were not far below seasonal levels. The coolest days were the 9th, 12th and 14th, on which dates many stations (particularly those in Southern New England) registered their lowest temperature for the month.

From the 15th through the 28th, a pronounced shift in the daily march of temperature held sway. The high readings of the 1-3rd were not exceeded, yet daily plus departures averaged 5-10 degrees above normal. Precipitation continued to occur frequently, although amounts remained just as light, with one outstanding exception (storm of 22-23rd). Snow was of course rare.

During this period the atmospheric circulation patterns were such that no cold Canadian air was able to invade New England. Relatively warm air masses persisted over the region, and there was a tendency for high pressure areas to linger and inhibit the direct flow of chill temperatures from the north, and to block the entry of storm centers. Thus, while severe weather visited the Mid-West and even penetrated to parts of the East and South, New England lay in comparative shelter. The most dramatic weather sequence of the month occurred during this favored interval, however, and posed the threat of a serious New England storm that fortunately did not eventuate. On the morning of the 20th, a trough of low pressure lay along the line from Lake Ontario to Florida, with a LOW center developing in the trough over interior South Carolina and high pressure over the Northeast. The situation was reminiscent of that which produced the great storm of November 25-26, 1950. The LOW intensified, first drifting slowly eastward then heading northwestward, and reached a central position over Ohio early on the 22nd. There it turned northward and moved into Hudson's Bay on the 24th. As the center thus passed a considerable distance west of New England, the effects of the disturbance were relatively minor. No damaging winds, such as occurred in the 1950 gale, were reported, but the large precipitation area associated with the storm did sweep over the Section, giving general heavy precipitation on the 22-23rd.

Hard on the heels of this storm threat, another appeared on the 25-26th, when severe weather struck the central third of the nation. Once again, however, a ridge of HIGH protected New England during the critical period. The LOW center travelled northward into Canada, and the Section received only light precipitation as the trough trailing down behind passed eastward over the Section on the 27th. Behind the trough, an extensive polar HIGH overspread the country, and dominated New England during the final days of the month. This cold air mass brought an end to the spell of above-normal temperatures that reigned from the 15th through the 28th. Sub-freezing minimum temperatures were general on the 29th and 30th, when many stations reported their low readings for the month. The period from the 27th on was marked by light snow.

At the close of November, water supplies were at unfavorable levels throughout New England. Groundwater and streamflow averaged greatly below normal. Reservoir levels, though slightly better off, were still considerably below normal.

The average Section temperature, based on the records of 164 stations, was 39.3° or 1.1° above the 65-year November mean. The highest temperature recorded was 75° at Weston, Mass. on the 2d; the lowest was 3° at Somerset, Vt. on the 9th and Lemington, Vt. on the 14th. The highest monthly average temperature was 46.0° at Block Island WB Airport, R. I.; the lowest was 29.8° at Caribou WB Airport, Me.

The average Section precipitation, based on the records of 168 stations, was 2.23 inches. This was 1.42 inches below the 65-year mean. The greatest monthly amount reported was 7.78 inches at Walcott Reservoir, Conn.; the lowest was 0.62 inch at Northfield Norwich Univ., Vt. The greatest amount measured in any one observational day was 4.57 inches at Bristol 2 W, Conn. on the 23rd. Section snowfall averaged 1.8 inches, compared to the 65-year mean of 4.5 inches. - J.K.McG.

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5 and 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 A.M. E.S.T. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

- - No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.
- †† Mount Washington, New Hampshire not used in computing averages or extremes for State or Section.
- + And also on a later date or dates.
- * Amount included in following measurement, time distribution unknown.
- // Gage is equipped with a windshield.
- AR This entry in time of observation column in the Station Index means after rain.
- E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
- M One or more days of record missing; see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
- R Daily values and monthly total from recording gage.
- S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July, August and December issues of this publication.
- SS This entry in time of observation column in the Station Index means sunset.
- T Trace, an amount too small to measure.
- V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CHATTANOOGA: 1953

NEW ENGLAND - DECEMBER 1952

James K. McGuire, Section Director - Boston, Mass.

WEATHER SUMMARY

The last month of 1952 was mild; it brought only one major snowstorm and very little else in the way of severe weather; but it did bring above-average precipitation to New England, reversing the trend of the preceding Autumn months. Monthly amounts in excess of normal were recorded in nearly all parts of the Section except for isolated areas in the Southern Division and along the northeastern border of Maine. As a result, water supplies showed considerable and gratifying improvement.

State-average precipitation was slightly in excess of normal for Massachusetts and Connecticut, while Rhode Island's was barely sub-normal. All three states of the Northern Division averaged substantially greater than normal: maximum monthly totals, in the neighborhood of eight and nine inches, were concentrated in central New Hampshire and the adjacent portion of Maine. Noteworthy is the fact that this was the first month of above-normal precipitation in Maine, New Hampshire and Vermont since June. The frequency of occurrence of precipitation did not vary greatly over the Section from the average. Measurable amounts fell, in most locations, on 8-10 days during December; amounts near or greater than one inch occurred in many parts of New England on the 5-6th, 11-12th and 22-24th.

Snowfall was sub-normal in all areas except the upper reaches of Maine and the northern halves of New Hampshire and Vermont. In the latter areas, monthly totals in the 30-40 inch range were reported from stations in the White Mountains and in the northwest corner of the Green Mountain State. It was in these same areas - Vermont (north of Barre) and adjacent New Hampshire - that the weather highlight of the month occurred. On the 11-12th, one to two feet of snow fell on the region, with results to be described below. Aside from this heavy snowstorm, and a 12-inch fall over Northern Maine on the 6-7th, other occurrences of snow during the month brought generally light amounts.

December followed the temperature trend of all the months of 1952 except May and October in giving the Section an above-normal monthly average. Plus departures of 3-4 degrees were the rule at most New England stations. This net warmth did not mask extreme temperature fluctuations in either direction; rather, it reflected persistent above-normal conditions over practically the entire month. Except for brief and unimportant dips in temperature around the 15th and 20th, daily readings continued above-normal without interruption from the 5th through the 27th. Highest monthly values were observed at most Southern New England stations on the 11th; in the Northern Division on this or the following day. These maxima ranged from the 50's and low 60's in the south and west to the 40's elsewhere. The four opening days of the month averaged moderately below-normal, and no really cold weather arrived until the 28th. On this day the majority of the observers in southern and central New England read their low marks for the month as the mercury fell towards zero. Three days later, even colder temperatures surged into the northern part of the Section, and most stations there reported their monthly minima on the 31st.

December began with a ridge of HIGH pressure overlying the Eastern States and, far to the south, a trough of low pressure in the Gulf of Mexico. From this latter, a LOW developed and moved up the Atlantic coast. It reached a central position east of the Delaware Capes on the morning of the 3rd, and spread light rain and some snow into southern and central New England. Though the area of high pressure in advance of the LOW had somewhat weakened, a fresh flow of cold air from eastern Canada built up increased resistance on the 4th. Precipitation ended in New England as the storm center was shunted far out into the ocean. On the western side of the high pressure area, however, a low pressure trough now moved into the Mississippi Valley. The precipitation band ahead of it reached western New York State on the morning of the 5th, and the ridge of HIGH pressure retreated off the New England coast. The 5-6th thereupon brought heavy precipitation, as the trough moved eastward across the Section and a LOW center associated with it moved from western Connecticut on the morning of the 6th to the Bay of Fundy twenty-four hours later. This latter development caused a continuation of the precipitation into the 7th over Northern Maine. Since temperatures there were sub-freezing, snow fell on the 6-7th over this area, and Caribou, Me., measured a two-day total of 13.8 inches.

The period of the 8-10th was marked by light and scattered precipitation and by temperatures well above seasonal levels. For the second time in the month, however, atmospheric forces were shaping up for another storm period.

At 1:30 A.M. (EST) on the 11th, a low pressure trough extended north-south from a center just east of Hudson Bay, Canada, through central New York and Pennsylvania, and thence southward to the tip of Florida. East of the trough, mild ocean air streamed into New England, causing temperatures on the afternoon of the 11th and 12th to rise at most stations to their maximum levels for the month. West of the trough, colder air pushed slowly eastward against the opposing atmospheric current, producing heavy precipitation in their conflict. At 1:30 P.M. on the 11th, the trough line lay along the western boundary of the Section; twelve hours later, moving slowly, it extended from the Upper Connecticut Valley south to Narragansett Bay. At 1:30 P.M. on the 12th, it entered eastern Maine, and not until the following morning did it pass out of that State.

Thus, the 11-12th brought general and heavy precipitation to the Section. In Connecticut, Rhode Island, eastern and southeastern Massachusetts, and coastal Maine, the precipitation fell as rain, generally 1-2 inches, in gusty easterly winds. Elsewhere there was snow. Western Massachusetts, southern New Hampshire and Vermont and most of Maine received, generally speaking, light amounts (4 inches or less). Heavy snow fell throughout northern Vermont and northern New Hampshire (including nearby Maine). Two-day totals exceeding 12 inches were common at stations in this area, ranging up to 24 inches.

Hardest hit by the storm was the 3500 square mile area of extreme northern Vermont, where a near-record depth of two feet accumulated. Heavy wet snow fell from midafternoon of the 11th to near-midnight of the 12th. Scores of communities, in the district north of Barre, were isolated as power and communication lines snapped under the weight of the snow and roads became impassable. Approximately 500 telephone poles were downed, severe damage to trees reported, and ten lives plus estimated $150,000 property losses were charged to the storm. By train and truck utility repairmen from other parts of New England were sped to the snowbound area. Highway patrols swung into action against the snow-clogged highways. During the week which followed (14-20th) the elements cooperated by bringing mild and generally fair weather, so that the storm's aftermath was considerably alleviated.

On the morning of the 21st, the month's third and last period of heavy precipitation began brewing. A LOW center formed off the South Carolina coast, headed northeastward, and on the 22nd reached a central position about 250 miles east of the Virginia Capes. Here, as happened to the earlier coastal storm (on the 4th), it was blocked by high pressure centered in the Gulf of the St. Lawrence. Consequently, it made little headway on the 22-23rd. The circulation around its northern side, however, combined with the air flow associated with the HIGH to pour a damp current of air from the Atlantic into New England. On the 24th, the HIGH gave way as a low pressure trough pushed eastward from the Great Lakes, and the coastal storm swung northward into Nova Scotia. The effect of these disturbances was to produce widespread heavy rain and light snow over the Section on the 22-23rd, prolonged to the 24th in northern areas. Amounts of precipitation were heaviest in southeastern New England, with Nantucket receiving 2.82 inches.

Christmas Day was accorded clearing weather, though scattered snow flurries occurred in the northern parts of the Section. The rest of December brought nothing outstanding in the way of precipitation until its very close; but it did constitute, from the 28th on, the coldest period of the month. With the atmospheric flow in back of it such that air streamed almost straight down from the Arctic, a low pressure trough moved southeastward across New England on the 27th. The following morning found the Section engulfed in the frigid northerly current. Near-zero readings were plentiful, even in the Southern Division, and sub-zero temperatures not uncommon. The cold snap continued, being intensified on the 30th when a fresh surge of cold air pushed into Northern Maine, and penetrated to Long Island Sound on the morning of the 31st. Minimum temperatures in the northern part of the Section on the 31st were generally the lowest of the month; the southern and central portions did not bear the full brunt of the cold air invasion, so that their monthly minima tended to be those observed on the 28th.

As the year closed, December's last coastal storm was making its way from Hatteras towards Cape Cod. Precipitation had reached northward into Southern New England. The New Year was to begin with snow, rain, hazardous street and highway conditions, and 1952 bowed out with a wintry flourish.

As mentioned in the first paragraph above, December's above-average precipitation did much to counteract the effects of the dry Autumn season. Monthly runoff was generally above normal in the Northern Division; in Vermont and New Hampshire this was true for the first time since June. In Rhode Island and southeastern Massachusetts runoff continued deficient, but improved considerably with respect to percent of normal. Elsewhere in the Southern Division runoff was generally near-normal. Ground-water levels rose throughout the Section, and at the month's close were predominantly near or above average except in the southeastern portion. Reservoir storage was about normal in most areas.

The average Section temperature, based on the records of 168 stations, was 29.6° which is 3.1° above the 65-year December mean. The highest temperature recorded was 62° at Springfield, Mass., and Norwich and Windsor Locks, Conn., on the 11th; the lowest was -23° at Lemington, Vermont on the 31st. The highest monthly average temperature was 38.7° at Provincetown, Mass., the lowest was 18.9° at Caribou, Maine.

The average Section precipitation, based on the records of 169 stations, was 4.43 inches which is 1.06 inches above the 65-year mean. The greatest monthly amount reported was 9.17 inches at Pinkham Notch, N. H., the least was 1.46 inches at Washington, Conn. The greatest amount measured in any one observational day was 3.87 inches at Peru, Mass. on the 12th. Section snowfall averaged 8.6 inches, compared to the 65-year mean of 11.3 inches.
J. K. McG.

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CORRECTIONS

MONTH: JANUARY 1952

Table 2: New England	Precipitation departure from normal should be +.76.

MONTH: FEBRUARY 1952

Table 2: New Hampshire	Temperature departure from normal should be +4.1.

MONTH: AUGUST 1952

Table 2: Houlton 1 NE, Maine	Average maximum temperature should be 80.2; average temperature should be 66.8; departure from normal should be +3.2.
Table 3: Sterling, Massachusetts	Amount on 31st should be T; monthly total should be 6.95.

REFERENCE NOTES

The four digit identification numbers in the index column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning with July 1948.

Amounts in Table 3 are from non-recording gages, unless otherwise indicated.

Data in Tables 3, 5 and 6 and snowfall data in Table 7 are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA stations. For these stations snow on ground values are at 7:30 A.M. E.S.T. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

-	No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry
††	Mount Washington, New Hampshire not used in computing averages or extremes for State or Section.
+	And also on a later date or dates.
•	Amount included in following measurement, time distribution unknown.
	Gage is equipped with a windshield.
AR	This entry in time of observation column in the Station Index means after rain.
E	Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
M	One or more days of record missing, see Table 5 for detailed daily record. Degree day data, if carried for this station, have been adjusted to represent the value for a full month.
R	Daily values and monthly total from recording gage.
S	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July, August and December issues of this publication.
SS	This entry in time of observation column in the Station Index means sunset.
T	Trace, an amount too small to measure
V	Includes total for previous month.

Subscription Price 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscription should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

NEW ENGLAND

ANNUAL SUMMARY 1952
Volume LXIV No. 13

CHATTANOOGA: 1953

NEW ENGLAND - 1952

James K. McGuire, Section Director - Boston, Mass.

WEATHER SUMMARY

The year was unusually warm, with only two months (May and October) having sub-normal average temperatures. July had the highest average temperature of any month of record. Precipitation averaged very close to normal for the year, with heavy amounts received in June, August and December counterbalanced by much below normal totals in July, September, October and November. The July drought wreaked havoc with crops and pastures, and New England farmers suffered multimillion-dollar losses in consequence. The Autumn dry spell, particularly severe in the Northern Division (Maine, New Hampshire, Vermont) caused a general reduction of ground water supplies to sub-normal levels; the water shortage was critical in many Maine communities. Snowfall was near average, but only because of heavy snow in February that compensated for the deficiency of the rest of the year.

With an average temperature of 47.3° for the Section, 1952 was 1.3° above the 65-year mean. Only seven years since 1888 have had higher annual averages. The maximum temperature reading during the year was 102°, recorded at several stations on June 26th, July 7th or July 23rd. The lowest was -46° at Lac Frontiere, Maine, on January 30th. The station having the highest annual average was Waterbury (City Hall), Conn. with 53.9°; the lowest was First Connecticut Lake, N. H. with 39.2°.

Total average precipitation for New England was 41.92 inches, or 0.03 inch below the 65-year normal. August had 4.82 inches, the highest total of any month of the year. The greatest annual amount of precipitation observed at any station was 65.46 inches at Wolcott Reservoir, Conn.; the least was 29.37 inches at The Forks, Me. The greatest local monthly amount was 13.56 inches in August at Kingston, R. I. The greatest reported in any observational day was 4.80 inches at Groton, Conn., on August 6th.

Snowfall for the year totaled 65.6 inches, just 1.8 inches above average. February had the highest monthly total, 27.0 inches.

January had several short periods of typical sub-zero winter severity, interrupting its prevailing mild temperatures. On the 30-31st, most New England stations recorded their minimum for the year. Precipitation was moderately above normal, due to the passage, at intervals of two or three days, of storm systems moving northeastward from the Lower Plains States, with secondary coastal developments that became the principal storm centers as far as New England was concerned. Temperatures being in the critical range near 32°, much of the precipitation attending these disturbances fell as rain in the southeastern part of the Section and as snow elsewhere. Such was the case in the storm of the 5-6th, which gave heavy rain in the southeast but up to 14-15 inches of snow in the central and northern portions. Two days later, a coastal storm brought 2-5 inches of moist snow to Nantucket and Cape Cod, along with northeast gales that damaged coastal property and utility lines. For the Section as a whole, the month's snowfall averaged slightly sub-normal.

February was also much above-normal in temperature and moderately above in precipitation. It brought more intense storm activity than January, however, coupled with considerably heavier snowfall. The Northern Division averaged 34.3 inches, almost twice the usual amount; the Southern Division, with 17.7 inches, was moderately above average. During the first decade there was frequent precipitation along with temperatures ranging about 10° above normal. On the 12-13th, a coastal storm gave Maine, particularly its northeastern portion, 12-30 inches of snow. Drifts up to 20 feet in places disrupted transportation and communication throughout all northern Maine. West and northwest gales to the rear of the storm buffeted southern New England, wreaking widespread damage. By the 14th, the dry winds had created a woodland fire hazard, unusual for the time of year, but the danger was eliminated by a heavy snow storm on the 17-18th. On those dates, a "howling northeaster" attending a very severe ocean storm caused extremely heavy seas, splitting two tankers with a loss of six lives. The storm brought 3-30 inches of snow to the Section, with measurements increasing with distance inland and northward. In Maine, the new snow, added to the deep cover previously prevailing paralyzed traffic all over the state. Again on the 27th, a coastal storm developed great intensity with devastating effects to Cape Cod, Nantucket and Martha's Vineyard. Doubtless that areas's heaviest snowstorm in more than 50 years, it brought up to two feet of snow. Strong gales and abnormally high tides capped the storm havoc.

March brought frequent storms and a lack of sunshine. There were no marked extremes of temperature and the month averaged just about normal. Precipitation (including snowfall) was moderately below average. Only the thunderstorms on the 4-5th and the squalls and heavy snow of the 11-12th caused significant damage. The deepest snow cover of the winter occurred during the first decade of the month. Depths of 35-45 inches were common from central New Hampshire northward and eastward, the greatest accumulation being 60 inches on the 5th at North Bridgton, Me. The mountain areas and central and northern Maine lost little of this deep snow cover until the third week, when it began to deplete with little serious flood threat. Winter sports activity benefited by the prolongation of favorable snow conditions, which was especially welcome after three previous winters of inadequate snowfall.

April was a singularly quiet month. Although the general level of temperature ranged 3-6° above normal for the first three weeks, there was no extreme warmth. This fact, in conjunction with light, scattered rainfall and generous sunny periods intervening, permitted the continued orderly run-off of the snow cover without dangerous flooding. The weather was also highly favorable to awakening plant life. The 19-21st, however, saw an epidemic of forest fires in all six states, destroying timber and houses valued in excess of $500,000. The last six days brought a reversion to raw winds off the ocean with heavy rains along the coast. Snowfall was very light, and precipitation averaged moderately above normal.

May interrupted the succession of warmer than usual months with an average temperature some 2° below the normal. Daily readings, however, followed remarkably close to the normal march of temperatures, again with a noticeable absence of extremes. There were only a few unusually cold nights and not until the 28th was there a day with maximum readings generally in the 80's. Precipitation, as in April, was moderately in excess of normal. Showers were frequent after the 9th, and despite adequate sunshine the ground remained in a moist condition, delaying lowland plantings though pasturage and foliage throve. A typical spring easterly storm on the 11-12th caused a general heavy rain. Local thunderstorms swept across southern New Hampshire and northeastern Massachusetts on the 29th, causing comparatively small lightning and hail losses.

June was characterized by above normal temperatures, climaxed in most places by extreme heat on the 26th; by an excess of precipitation, particularly in the northwest where heavy rains on the 1-2nd produced local flooding; and by numerous showers and thunderstorms interspersed among warm days with ample sunshine. In north-central Vermont and adjoining New Hampshire, 2-4 inches of rain fell on already saturated valley lands and high water levels. Streams rose rapidly on the night of the 1-2nd, blocking highways, washing out bridges and necessitating the evacuation of hundreds of dwelling-places. On the 17th, thunderstorms struck the Greater Boston area and Addison Co., Vt.; lightning damage to property and hail devastation to crops were severe. On the 26th most of New England sweltered under exceptional heat. While only a few stations in Maine reported maxima higher than the 80's, all over the rest of the Section maxima of 90° and above were common and some places exceeded 100°. At least seven deaths and scores of heat prostration cases resulted before cooler air swept southward during the late afternoon and evening of that day. This gratifying change had its drawback, being accompanied by severe thunderstorms in which intense lightning activity and high winds took a heavy property toll. On the whole, most crops made good headway during the month.

July, however, struck a severe blow to New England agriculture. The month attained the highest average temperature of any month of record, 72.8°, or 3.6° above normal. Afternoon readings in the 90's were unusually frequent. The beginning and end of the month were comparatively cool; except for a similar brief spell on the 10th, the main part of July brought sustained high readings, with three rather evenly-spaced crests about the 7th, 14th and 23rd during which temperatures at some stations exceeded 100°. A general deficiency of rainfall combined to cause multimillion-dollar crop losses. Massachusetts, New Hampshire and Maine were designated "disaster areas" to permit farmers to apply for emergency loans. The drought was especially severe in eastern and southeastern New England, where a number of stations reported a mere few hundredths of an inch of rain during the entire month. For the Section, average precipitation was half the normal, and the second-lowest of any July total of record. State forests in Maine and Massachusetts had to be closed, and in both states numerous woods-fires occurred. Severe thunderstorms on the 14th in extreme northeastern Maine, on the 27th in northeastern Massachusetts and on the 31st in north-central Massachusetts caused property and crop losses from wind, lightning and hail in excess of $1,000,000 aggregate. In Salem Harbor and nearby coastal waters, the thundersquall of the 27th capsized an estimated 200 small craft and caused numerous narrow escapes and five deaths by drowning.

August was moderately above normal in temperature and much above in rainfall. The first half of the month brought frequent showers and generally seasonable temperatures. The second half was less rainy and less uniform in temperature; cool weather prevailed from the 18-25th and the 30-31st, with an intervening heat wave on the 26-29th. Moderate-to-heavy rain fell over southern areas on the 2nd; the 5-6th and 10-11th witnessed general rainstorms with amounts ranging from heavy over Connecticut to light in northern Maine; the 16-17th brought widespread heavy rains. These three periods established the month's pattern of well above normal precipitation in the Southern Division and moderately below normal in the Northern. In Maine, New Hampshire and Vermont the three following Autumn months were also deficient in rainfall, so that water supplies were seriously reduced. In Southern New England, however, the August rains afforded a measure of relief to crops after the arid July. General thunderstorm activity on the 5th produced severe local storms in four areas of Massachusetts, New Hampshire, Rhode Island and Connecticut.

September followed the early autumnal pattern of mingled hot and chilly weather, and averaged moderately above-normal overall. The month gave a goodly number of dry, mild, sunny days, ideal for outdoor activity and farm work. Precipitation averaged moderately below normal. Conditions were favorable for the harvesting of the Aroostook Co., Me., potato crop, growth of which was ended by frost on the 8th or 15th. The Connecticut Valley tobacco crop, cut in late August and early September, made excellent curing progress. The month began on a stormy note, as the weakened remnant of Hurricane "Able" passed over the Section on the 1-2nd, bringing general moderate-to-heavy rain and only minor wind damage. The 4-14th was marked by predominantly fair weather, with a cold snap on the 7-9th and the warmest temperatures of the month on the 11-13th. The latter half of the month brought more frequent, though mostly light precipitation. Showers and thunderstorms on the 19th caused some $200,000 damage in the northern corner of coastal New Hampshire, and lesser losses in the Springfield, Mass., and Putnam, Conn., districts. The 27-29th brought the coldest weather of the month, but at its close wide areas in the Southern Division, along with lower New Hampshire and coastal Maine, remained frost-free.

October was cool, sunny and dry. Section average temperature was 2.3° below normal. After a warm opening week, crisp Autumn temperatures prevailed with an unusually severe cold snap on the 20-21st and another sharp cool spell on the 25-26th, in which the first killing frost was reported from the stations that had hitherto escaped. The first general and significant snowstorm of the season occurred on the 29th, with amounts ranging from traces over most of the Southern Division to as high as 11 inches in northern New Hampshire. Precipitation for the month was considerably below normal. It was extremely dry from the 8th on, with many stations reporting no precipitation of consequence, and the woods fire hazard became acute though no major conflagration occurred. The growing season was generally terminated on the 21st, and harvesting of late crops was aided by fair weather.

November continued the Autumn's sub-normal precipitation trend. Amounts were near or moderately below average over most of Connecticut, western Massachusetts and southern Vermont, but elsewhere monthly totals were about two-thirds of normal. The deficiency would have been much more acute were it not for the storm of the 22-23rd, which gave the lone heavy precipitation of the month. Snow was some three inches below average, occurring mainly as light falls during the 6-12th and 27-30th. Temperatures averaged about a degree above normal. They were generally below normal during the first half and well above normal during the second half. Extended or severe cold was conspicuous by its absence, and there were no major or damaging local storms. Though the low water supplies gave concern, the month was generally a pleasant one; agricultural activities, especially poultry and dairy farming, benefited from the mild weather.

December was very mild; it brought only one important snowstorm and very little else in the way of usual winter weather; but it did bring well above normal precipitation to the Section for the first time since August. In the Northern Division, it was the first month with surplus precipitation since June. As a result, ground water supplies showed considerable improvement. Temperatures until the 28th were predominantly mild; thereafter, sub-zero minimum readings were fairly widespread for the first time during the winter season. Precipitation occurred with about average frequency; amounts exceeding an inch were general on the 5-7th, 11-12th and 22-24th. Snowfall was sub-normal in all areas except the upper reaches of Maine and the northern halves of New Hampshire and Vermont. The Caribou, Me., region had a 12-inch fall on the 6-7th, but the month's major snowstorm occurred on the 11-12th. Southern and southeastern New England had heavy rain, but snow fell elsewhere in the Section and was deepest in extreme northern Vermont. This section had a near-record accumulation of two feet: highways were rendered impassable and costly damage to utility lines resulted. At the year's close, snow cover was restricted to the Northern Division (except coastal Maine). - J.K.M.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state. Figures and letters following the station name, such as 12 SSW, indicates distance in miles and direction from the Post Office.

Delayed data and corrections will be carried only in the June and December issues of Climatological Data.

- No record.
+ Also later date (dates) or months.
* Amount included in following measurement.
B Adjusted to full month.
C Data for recorder stations denoted by "C" are processed for special purposes and published in "Hourly Precipitation Data".
E Amount is wholly or partially estimated.
M Less than a complete month of record available; if average value is entered, less than 10 days of record are missing; see monthly Climatological Data for detailed daily record.
R Data from recording gage.
S Storage precipitation station. Data will be published in the July or August, or delayed data December issue of Climatological Data.
T Trace, an amount too small to measure.
V Includes total for previous month.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.
